Hydraulic or Electro-hydraulic Directional Valve

Model: WEH/WH.../5XJ

- ◆ Size 10~32
- ◆ Maximum working pressure 350 bar
- ◆ Maximum working flow 1100 L/min

Features

- Mainly used to control the opening, closing and direction of liquid flow
- Electro-hydraulic operation (WEH)
- Hydraulic operation (WH)
- Subplate mounting
- The mounting surface according to DIN24340 form A and ISO4401
- Spring or hydraulic centered
- Wet-pin DC or AC solenoid
- Optional manual emergency operation
- Individual or central electrical connection
- Optional switching time adjustment
- Optional pre-load valve in port P of the main valve
- Auxiliary component, optional
- Stroke adjustment of main spool
- Stroke adjustment of end position sensor
- Inductive or mechanical limit switch (proximity type) of the main spool

Function description, sectional drawing

Directional valve model WEH

The WEH directional valve is a directional spool valve with electro-hydraulic operation. It is used to control the opening, closing and direction of the liquid flow. The valve mainly consists of valve body (1), main control spool (2), main valve with one or two reset springs (3.1) and (3.2), pilot valve (4) with one or two solenoids "a" (5.1) and "b" (5.2). The main control spool is held in the neutral or initial position by the springs or pressure. For the valve with spring-centered, the two spring chambers (6) and (8) are connected to the oil tank through the pilot valve in the initial position. The pilot valve (4) is supplied with oil through the control line (7). The control oil can be supplied internally or externally (externally via port X). The main control spool (2) is hydraulically operated by the pilot valve (4). Due to the operating of the pilot valve on one end of the main control spool, the spool moves to the operation position, then the valve opens in the operation direction and the fluid flows from P to A and B to T or P to B and A to T. The control oil can be drained internally or externally. An optional manual emergency operation (9) can move the control spool (10) in the pilot valve (4) when the solenoid is not energized.

Directional valve model WH

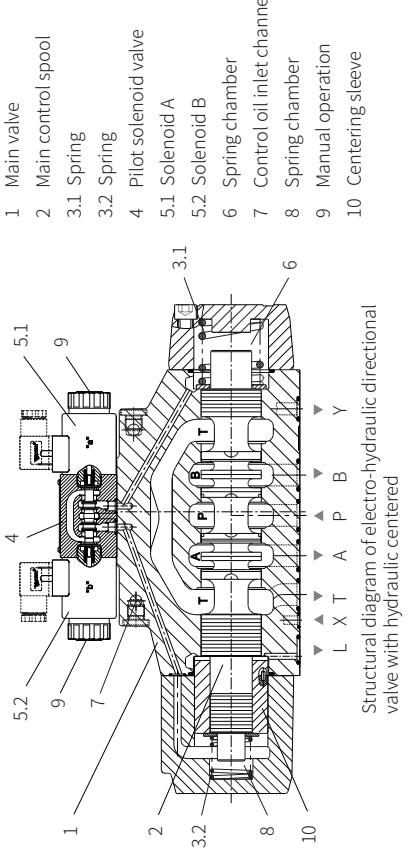

The WH directional valve is a hydraulically operated directional spool valve. It is used to control the opening, closing and direction of liquid flow. The valve mainly consists of valve body (1), main control spool (2), main valve with one or two reset springs (3.1) and (3.2) with spring centered or spring return functions, and control cover (11). The main control spool is operated by hydraulic direct. The spool is held in the neutral or initial position by springs or hydraulic pressure. The control oil is supplied and drained externally. For the 4/3-way valve with spool spring centered, the main control spool (2) is held in the neutral position by two centered springs. The two spring chambers (6, 8) are connected to the oil ports X and Y through the control cover (11). When one end of the main control spool (2) is pressurized, the spool moves to the working position, thereby connecting the corresponding oil circuit.

Function description, sectional drawing

4/3-way directional valve with hydraulic centered of main valve, model WEH..H/

In this structure, the pressure oil acts on both end surfaces of the main control spool (2). The centering sleeve (10) locates the main control spool (2) and keeps it in the middle position.

If one end of the main control spool (2) is unloaded, the main control spool (2) moves to the working position under the pressure from the other end, thereby changing the direction of the oil flow. The unloaded control spool face displaces the returning pilot oil into port Y externally through the pilot valve (4). The oil is drained internal from port L to the tank directly.

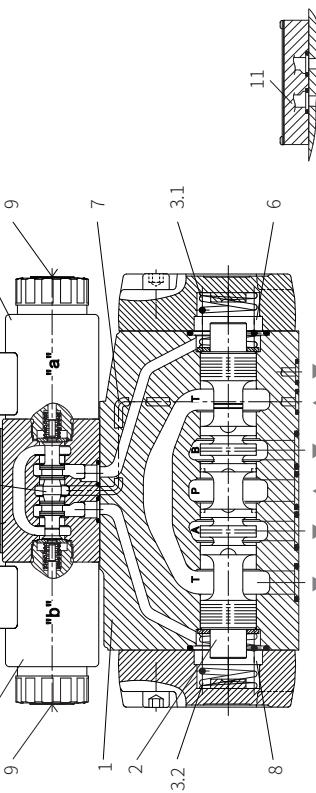

● Model WEH16

◆ Internal supply and drain:

The small end of pin (4) on the top of the main valve is installed toward to the end cover without plug (5).

◆ External supply and drain:

The large end of pin (4) on the top of the main valve is installed toward to end cover with plug (5).

HZ, HY	300 300 300 300 300

Notice:

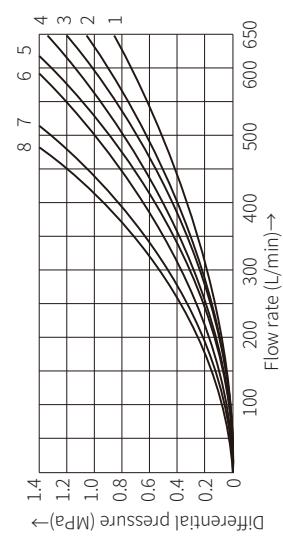

When using a 4/3-way valve with pressure centered in the main spool which exceeds the given performance limits, a higher pilot pressure is required. Therefore, if the pressure is 35MPa and the flow is 300L/min in the circuit, the pilot pressure of 1.6MPa is required.

The maximum flow of the valve only depends on the acceptable pressure drop through the valve.

- 1) The given flow value can be achieved when the minimum pilot pressure of 1.2MPa exists.
- 2) The given flow value is limiting the value at which the reset spring can return the valve when the pilot pressure decreases.

Switching time adjustment, pressure reducing valve and pre-load valve

Switching time adjustment

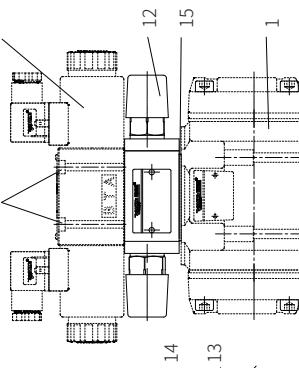

To control the switching time of the main valve (1), a double throttle check valve (12) is installed between the pilot valve and the main valve.

Conversion from meter-in control (13) to meter-out control (14):

Remove the pilot valve (4) but retain the O-ring support plate (15), turn the throttle check valve around its longitudinal axis and reassemble it on the mounting surface, install the pilot valve (4). Tightening torque $M_A = 9\text{Nm}$ for fixing screw (16).

Model 4WEH.../S or S2

WEH16..5XJ/...

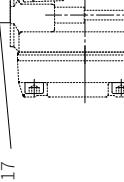

Model 4WEH.../S or S2

Pressure reducing valve "D3"

The pressure reducing valve (17) must be used if the pilot pressure exceeds 25MPa. The secondary pressure should be maintained at 4.5MPa. When using the pressure reducing valve D3, it must install a plug-in throttle B10 in port P of the pilot valve.

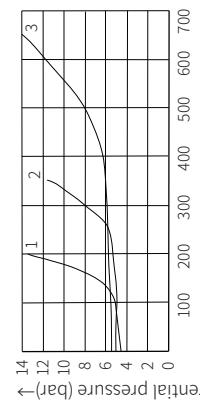

Tightening torque $M_A = 9\text{Nm}$ for fixing screw (16).

Model 4WEH.../D3

Pre-load valve

In the valve with pressureless bypass and internal pilot oil supply, a pre-load valve (18) is installed in port P of the main valve to built up the minimum pilot pressure.

Dimension of additional devices for model WEH16

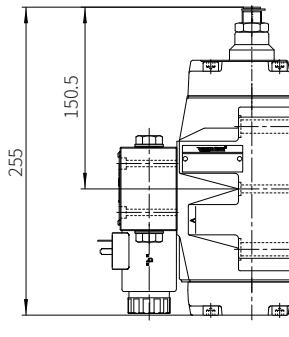

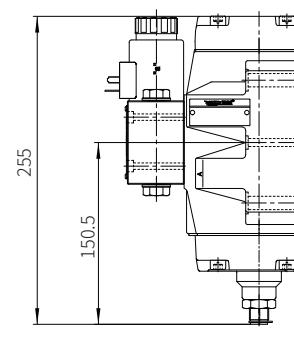

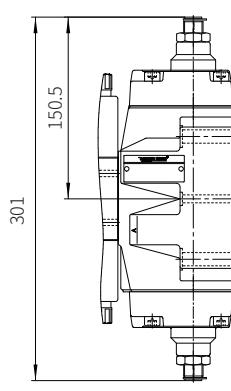

The installation range of the stroke adjustment is 10mm. The stroke limiter is used to adjust the stroke of the main spool.
Loosen the lock nut and rotate the adjusting rod clockwise, the stroke of the main spool will be shortened (the adjustment must be carried out without pressure in the control chamber)

1 turn = 1.5mm stroke

Technical parameters	09-10
Characteristic curve	11-15
Characteristic limit	11-15
Switching time adjustment, pressure reducing valve and pre-load valve	16
Component size	17-25

Features

- Mainly used to control the opening, closing and direction of liquid flow
- Electro-hydraulic operation (WEH)
- Hydraulic operation (WH)
- Subplate mounting
- The mounting surface according to DIN24340 form A and ISO4401
- Spring or hydraulic centered
- Spring or hydraulic return to initial position
- Wet-pin DC or AC solenoid
- Optional manual emergency operation
- Individual or central electrical connection
- Optional switching time adjustment
- Optional pre-load valve in port P of the main valve
- Auxiliary component, optional
- Stroke adjustment of main spool
- Stroke adjustment of end position sensor
- Inductive or mechanical limit switch (proximity type) of the main spool

Stroke adjustment installed on the end A of the main valve.../11
(2-position valve, symbols C, D, K, Z)
