Pressure switch

Jiangsu Jiayite Hydraulics Co., Ltd.

COMPANY PROFILE

Jiangsu Jiayite Hydraulic Co., Ltd. is located in Xuyi County, Jiangsu Province. It is a hi-tech enterprise focuses on manufacture of hydraulic valves and manifolds as an Integration of Independent R&D, manufacture, sales, and services. The company pays attention to every detail, from manufacturing and logistics delivery to consumption experience. The company was certified by ISO9001: 2015 quality management system, and gained CE certification and importing and exporting license. We currently have about 600 manufacturing equipment of diverse categories, including testing devices, CNC, high-precision grinders, honing machines, and various high-speed lathes. The annual production capacity for hydraulic valves is more than 800,000 pieces.

The self-owned brand REKITH is with high quality and high cost performances, which considerably improve customers' market competitiveness. The products are exported to more than 20 countries and regions in North America, Europe, Southeast Asia, Asia, Latin America, and Africa. These products are widely applied to industries such as machine tools, injection machines, agricultural machines, metallurgy industry, vessels, military industry, environmentally-friendly equipment, construction machinery, coal mining machinery, engineering machinery, and aerospace etc.

Important notes

01.General information

1.1 Notice

This document is an important information for the correct selection, using and maintenance of the hydraulic products and manifolds. Properly using and maintenance of products can reduce failures caused by non-product quality issues and also extend the service life of products.

1.2 Customer's applicable responsibilities

Our company does not assume the quality responsibility due to product damage caused by the following situations:

1.2.1 Failure to operate according to our company's instructions and relevant national standards resulting in product damage.

1.2.2 Disassembly and assembly of products without consent or replacement with parts not designated by our company to result to product damage.

1.3 Important Information

Due to the product information of our hydraulic products is only applicable in a general sense, thus some content may not necessarily be applicable to the hydraulic products you have purchased. But it can prevent accidents and ensure trouble-free operation of hydraulic products only when strictly adhering to this product information and operating instructions.

1.4 Edition rights

It can only reproduce the whole or part of this product information electronically or mechanically with our written permission. Similarly, without permission, this product information can not be published, modified, disseminated, translated into other languages, or used or copied for any other purpose or by any other means.

1.5 Operating Instructions

1.5.1 Technical specifications and environment

Technical specifications: the following specifications apply to the used working fluid unless otherwise specified in the operating instructions:

The working fluid mainly composed of mineral oil meets the requirements of DIN 51524. The working temperature range 0 ° C to + 80 ° C, recommended 55 ° C (<72 ° C in the tank). It can find any deviation from this in the operating instructions. The oil cleanliness is NAS1638 Class 9, the oil cleanliness of the proportional valve is not lower than NAS1638 Class 8.

1.5.2 Climate environment conditions for operation

Unless otherwise specified in the operating instructions, the allowable environment temperature For the control devices: 0°C...+50°C

For devices with motor but no heat exchanger, cooled by free air circulation system on the surface: 0°C...+30°C

For devices with heat exchanger: <+40°C

02.Hydraulic valve installation instructions

2.1 General

The commissioning and installation of the hydraulic valve should follow the the below standards:

— German standard DIN 24346

— ISO standard ISO 4413

2.2 Washing of system and valve block

In order to meet the cleanliness requirements, the hydraulic system and integrated valve block must be repeatedly washed and continuously tested online by the particle counter. During the washing process, it is necessary to check the filter at any time and the filter element must be replaced as required.

2.3 Installation

After verifying the models of the hydraulic valve, ensure that the connection surface and bottom of the valves are clean, no rust, without moisture and oil.

2.4 Cleaning

2.4.1 During installation, it must ensure that the hydraulic valve and the surroundings are clean.

The tank should be sealed, and the pipeline and the tank must be free of dirt, rust, sand, debris, etc. The hot bending or welded pipelines must be pickled, flushed, and oiled. It is recommended to wipe with non-woven fabric.

2.4.2 The pipelines are made with seamless steel pipes in accordance with DIN2391 Parts 1 and 2.

2.4.3 The installation surface finishing according to $Ra \leq 0.8$, flatness $\leq 0.01\text{mm}/100\text{mm}$.

2.4.4 The fixing screws must meet the specifications and strength specified in the catalogue, and be tightened according to the specified tightening torque.

2.4.5 It is recommended to use the oil and air filters with the same accuracy as the hydraulic system filters.

2.4.6 When installing hydraulic valves, ensure that the installation surface and bottom are without moisture and oil.

If the oil is unavoidable on the connection surface, please tighten the screws manually firstly and then use the dynamic torque tool to tighten the screws according to the tightening torque value. If there are more than four screws, it should tighten the middle screw first.

2.4.7 The installation position of the hydraulic valve:

Directional valve: horizontally (the spool is in the horizontal direction)

Check valve without spring: vertically (the spool can be reversed closed under self-gravity)

Pressure switch with drain port: it must ensure that the maximum drain pressure does not exceed 2bar.

03.Commissioning and maintenance of hydraulic valve

3.1 Requirements for hydraulic maintenance personnel

The maintenance includes three separate activities: cleaning and care, inspection and repair.

The maintenance personnel shall meet the following requirements:

The maintenance personnel must be familiar with the functions of the hydraulic system in general (from the subsystem to its interaction with the functionality of the machine).

The maintenance personnel must be able to read hydraulic circuit diagrams, interpret various functions based on symbols, and understand the functional diagrams.

The maintenance personnel must understand the function and structure of hydraulic valve components.

3.2 Hydraulic oil

The hydraulic oil used should comply with the specifications in the catalogue, follow the pressure and temperature range, and do not exceed the recommended maximum temperature. In order to ensure constant response characteristics, the hydraulic oil temperature should be kept constant (± 5 °C). The hydraulic oil should be avoided from contamination at all times to prevent jamming of hydraulic valves.

3.3 Sealing material

It should choose NBR, HNBR or FKM seals according to the type of oil and the highest or lowest temperature conditions. Please consult our company specifically.

3.4 Filtering

Please comply with the maximum allowable contamination specified in the catalogue. The filtering elements used must not exceed the specified maximum pressure difference. It is recommended to use a filter with a blockage indicator. It must keep clean when replacing the filter. The pollutant on outlet side of the filter will be flushed into the system and cause failure, and the pollutant on inlet side of the filter will reduce the service life of the filter element.

3.5 Maintenance

It must be replaced in time because of the natural wear and aging of the seals.

3.6 Storage

It must be stored in a place which dry, dust-free, no corrosion and steam. When the storage period exceeds 6 months, the valve should be injected with anti rust oil and then sealed.

Function description, sectional drawing

The RVP type check valve is used to allow the oil to flow freely in one direction without allowing reverse flow.

The stroke of the valve core is limited by the spring seat, and the built-in spring keeps the valve core in a closed state.

The RVP type check valve is a conical valve structure with low pressure loss. It is mainly used at the outlet of the pump as a back pressure valve and bypass valve.

Features

- Insert into the manifolds blocks
- Reverse closing without leakage
- 6 optional cracking pressure

Function description, sectional drawing

The M-SR...KE...1XJ/ type plug-in check valve is used to allow oil to flow freely from one direction only. The spring inside keeps the valve core in a closed state.

M-SR...KE...1XJ/ plug-in check valve valve mainly includes:

- (1) Valve sleeve
- (2) Valve core
- (3) Spring seat
- (4) Spring

The check valve has a conical valve structure with low pressure loss.

It is mainly used at the outlet of the pump as a back pressure valve and bypass valve.

As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Functional description, sectional drawing

The Z1S6 type valve is a direct operated check valve with a modular structure. This check valve is closed without leakage in one direction and allows free flow in the other direction.

The stroke of the conical spool (3) is limited by the spring seat (4). The spring (5) causes the conical spool (3) to close. When there is no fluid flows through the valve, the spring (5) holds the conical spool (3) in the closed position.

Model Z1S6...3X/V (metal-sealed)

This valve has a metallic seal between the conical spool (3) and the valve body (1). Therefore, it is particularly suitable for condition of working pressure higher than 100bar and the flow rate greater than 4m/s.

Modular Check Valve

Model: Z1S10...3XJ

- ◆ Size 10
- ◆ Maximum working pressure 315 bar
- ◆ Maximum working flow 100 L/min

Contents

Function description, sectional drawing	02
Models and specifications	02
Functional symbols	03
Technical parameters	03
Characteristic curve	04
Component size	04

Features

- Modular type valve
- For vertical stacking installation

Functional description, sectional drawing

The Z1S10 type valve is a direct operated check valve with a modular structure. This check valve is closed without leakage in one direction and allows free flow in the other direction.

The stroke of the conical spool (3) is limited by the spring seat (4). The spring (5) causes the conical spool (3) to close. When there is no fluid flows through the valve, the spring (5) holds the conical spool (3) in the closed position.

Model Z1S10...3XJ/V (metal-sealed)

This valve has a metallic seal between the conical spool (3) and the valve body (1). Therefore, it is particularly suitable for condition of working pressure higher than 100bar and the flow rate greater than 4m/s.

Model Z1S10...3XJ/

Features

- For vertical stacking installation
- One or two working oil ports blocked for leakage-free as required.

Function description, sectional drawing

The Z2S type is a superimposed structure hydraulically control check valve. This type of valve can keep one or two working oil ports leakage-free even if it works for a long time.

There is a free flow in the direction A1 to A2 and B1 to B2 but closed in the opposite direction. When the oil flows from A1 to A2 or B1 to B2, the piston (1) works, the control spool (1) is moved to the right or left and pushes the valve spool (2) away from its seat. In order to ensure the valve spool (2) to be closed safely, the oil must flow from B2 to B1 or A2 to A1. The working oil port of the directional valve must be connected to the oil tank in the neutral position (see circuit example).

Function description, sectional drawing

The Z2S type is a superimposed structure hydraulically controlled check valve. This type of valve can keep one or two working oil ports leak-free even if it works for a long time.

There is a free flow in the direction A1 to A2 and B1 to B2 but closed in the opposite direction. When the oil flows from A1 to A2 or B1 to B2, the control spool (1) is moved to the right or left and pushes the valve spool (2) away from its seat. In order to ensure the valve spool (2) to be closed safely, the oil must flow from B2 to B1 or from A2 to A1. The working oil port of the directional valve must be connected to the oil tank in the neutral position (see circuit example).

Model Z2S6...6XJ/(without pre-opening)

1 Control spool, area A2
2 Valve spool, area A1

Version "S055" (with pre-opening)

This valve is set-up with an additional pre-opening. The control spool (1) will be moved to the right by applying pressure to port X.

To do this, it should push the ball (5) away from the valve seat firstly, then push the spool (2). Now the valve allows fluid to flow from B to A as well.

Model Z2S6...-6XJ/S055 (with pre-opening)

1 Control spool, area A2
2 Valve spool, area A1
3 Pre-opening, area A3.

Hydraulic-operated Check Valve

Model: SV/SL6...6XJ

- ◆ Size 6
- ◆ Maximum working pressure 315 bar
- ◆ Maximum working flow 60 L/min

Contents

Function description, sectional drawing	02
Models and specifications	03
Functional symbols	03
Technical parameters	04
Characteristic curve	04
Component size	05

Features

- Hydraulic-operated check valve
- Connection dimensions according to DIN 4401-03-02-0-05
- Subplate mounting
- With or without drain port as required
- With or without pre-opening port as required
- Various opening pressures

Function description, sectional drawing

The SV and SL valves are hydraulic-operated check valve for subplate mounting. It is used for leakage-free blocking of one working port even in the event of long-term shutdowns.

The valve mainly consists of valve body (1), seat poppet (2), compression spring (3), control spool (4) and an optional pre-opening ball seat valve (7). The seat valve allows the fluid to flow from A to B without external pilot pressure.

Condition: $P_A > P_B + \text{cracking pressure}$ (compression spring). In the opposite direction, the seat valve is hydraulically closed. The high pilot pressure at port X moves the control spool (4) in the direction of the seat valve and pushed the seat poppet (2) away from its seat. This enables free flow in both directions (actively hold open).

In order to ensure that the seat valve opens actively, the pressure conditions on both sides of the control spool (4) are same important as the area ratio on the seat poppet (2) or (7).

Therefore, it results different types as below:

-SV (large spool surface $A_2(6)$ connected to P_A) or

-SL (small front surface $A_x(8)$ connected to P_A ,

- Models with pre-opening "A" and without pre-opening "B"

Model "A" with pre-opening

The valve is equipped with an additional pre-opening. By applying pressure to the port X, the control spool (4) will move to the right. In this way, the ball (7) and the seat poppet (2) will be pushed out of the valve seat successively.

Note!

Model "A":

Due to the using of a two-stage structure with enlarged opening control area ratio, safe unloading is also possible with lower pilot pressures.

Model SV6PB...-6XJ/

Model SL6PA...-6XJ/

	Type	Plug (9)	Plug (10)
5 area A1 (seat poppet)	SV	M3 (open)	M6 (closed)
6 area A2 (control spool)	SV	M3 (open)	M6 (closed)
7 area A3 (ball)	SL	M3 (closed)	M6 (open)
8 area A4 (control spool)	SL	M3 (closed)	M6 (open)

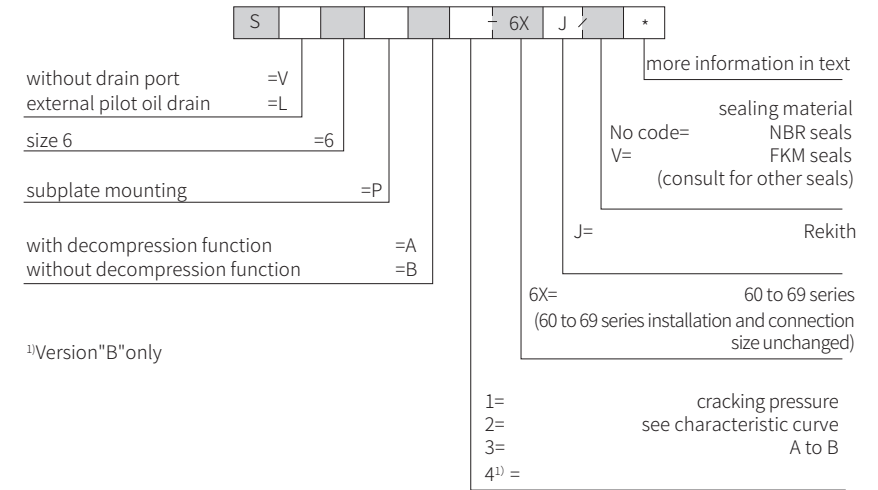

Avoidance of switching shocks due to the attenuation of the pressure volume on the actuator side.

Model "B":

When the valve without pre-opening, it may suddenly unloaded the contained pressure volume. The resulting switching shocks may not only creates noise but also wears of mounting components early.

The conversion between SV type and SL type can be achieved by replacing the plugs (9) and (10). One of the plugs must always be installed!

As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The SV and SL valves are hydraulic-operated check valves with a poppet valve structure which can be opened to allow flow in the reverse direction.

This type valve is used to isolate parts of the hydraulic circuit as a safety measure to prevent load loss of pressure when the pipe bursts, or to avoid creeping movements of actuator during hydraulic lockout.

It mainly consists of the valve body (1), spool (2), compression spring (3), control piston (4) and an optional pressure relief ball valve (5).

Model SV..

The fluid can flow freely from A to B. In the opposite direction, the spool (2) is firmly held on its seat by the compression spring and system pressure. By applying pressure to control port X, the control piston (4) is pushed to the right. In this way, the spool (2) leaves the valve seat and the fluid flows from B to A.

In order to ensure the opening of the valve, a certain minimum pilot pressure is required to act on the control piston. And a certain minimum pilot pressure is necessary to ensure that the valve can open by applying pressure to the control spool (4).

Models SV...A.. and SL.A.. (with decompression function, section 1)

The valve has an additional unloading mechanism. When control pressure is provided to port X, the control piston (2) is pushed to the right. It firstly pushes open the ball spool (5.1), then the main spool (2) lifts off its seat. In this way, the fluid flows from B to A, thereby avoiding possible pressure shock.

Due to this pre-opening feature, it can achieve a stable decompression of the pressurized fluid in the cylinder.

Model SL...

The function of this valve is the same as model SV. The difference is in the addition of drain port Y. Here the annular area of the control piston (4) is isolated from port A. The pressure from port A only acts on the area A4(9) of the control piston (4).

Model SV...PA..-4XJ
(No oil drain port, with unloading function)

Model SL...PB..-4XJ
(With drain port, no unloading function)

Manual Directional Valve

Model: WMM...5XJ

- ◆ Size 10
- ◆ Maximum working pressure 350 bar
- ◆ Maximum working flow 160 L/min

Contents

Function description, sectional drawing	02
Models and specifications	03
Functional symbols	03
Technical parameters	04
Characteristic curve	04-05
Component size	06

Features

- Direct operated directional spool valve with handle
- With reset spring or detent, optional
- Subplate mounting

Function description, sectional drawing

The WMM manual directional valve is a direct operated directional spool valve which switches the oil circuit by rotating the handle to move the spool axially. It has 3/2-way, 4/2-way, 4/3-way as well as various spool symbols, and it is subplate mounting with optional detent and spring reset.

Model 4WMM 5XJ/

The valve is composed of valve body (1), handle (2), control spool (3), one or two reset springs (4), etc.

The control spool (3) is held in the middle or initial position by the reset springs (4) in no operation condition. When the handle (2) is pushed to the right or left, the handle pushes the push rod (5) via hinge and controls the valve spool (3) directly to force the spool to move to the required position to obtain the required flow cross-section. When the handle returns to the zero position, the control spool returns to the normal position by reset spring (4). The switching position of this valve is operated by the handle.

Model 4WMM 5XJ/F

The principle is basically the same with WMM...5XJ/. But this type valve is a control valve with two or three switching positions and one detent. Therefore, all the switching positions are fixed.

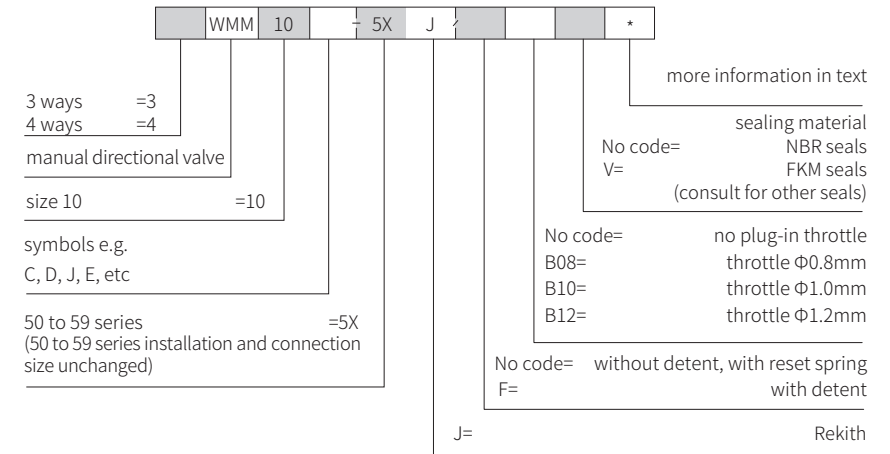

Plug-in throttle

Due to working conditions limitations, it may occur that the flow of the valve exceeds the specified flow rate on the valve performance curve during switching process, then the use of a throttle is required. It is installed in the P chamber of the valve or oil circuit.

This type valve has advantages such as small volume, large flow capacity, and good reliability compared to other series of valves. It can be used together with the modular valves in same size, and widely used in engineering machinery, coal mining machinery, chemical machinery, light industry machinery, locomotives and many other industries.

Characteristic curves of other symbols

Characteristic limit

Due to blockage, the switching function of the valve is related to filtration. In order to obtain the specified maximum flow, it is recommended to use a 20um full-flow filtration. The various forces acting on the valve also affect the flow characteristics.

For a four-way valve, the specified flow data is valid for normal operation with two flow directions (i.e. from P to A and return flow from B to T at the same time)(see table). If only one direction of flow is needed, e.g. when the four-way valve with chamber A or B blocked is used as three-way valve, the maximum flow rate will greatly decrease in severe cases.

Features

- Direct operated directional spool valve with rotary knob
- Subplate mounting

0083

Function description, sectional drawing

The WMD rotary directional valve is a direct operated directional spool valve that switches the oil circuit by rotating the handle to move the spool axially. It has 3/2-way, 4/2-way and 4/3-way as well as various spool symbols, and it is subplate mounting valve with detent.

The valve consists of valve body (1), rotary knob (2), control spool (3) and reset spring (4).

The control spool (3) is held in the neutral or initial position by the reset spring (4) in no operation on the rotary knob (2). When the rotary knob (2) is pushed to the right or left, the control spool (3) is directly controlled through the connecting rod and moved to the required position to obtain the required flow cross-section.

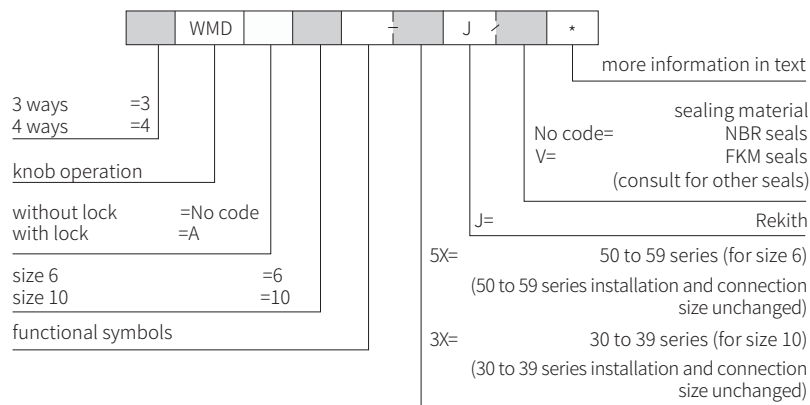

Plug-in throttle:

Due to working conditions limitations, it may occur that the flow rate of the valve exceeds the specified flow rate on the valve performance curve during the switching process. In this case, a throttle is required. It is installed in the P chamber of the valve or oil circuit.

Working limit

(Measured when using HLP46, $\vartheta_{oil}=40^{\circ}\text{C} \pm 5^{\circ}\text{C}$)

Due to blockage, the working performance of the valve is related to the filtration accuracy. In order to obtain the given flow value, it is recommended to use 25um full-flow filtration. The various forces inside the valve also affect its working limit.

Therefore, for a four-way valve, the given flow value is valid for normal operation when two flow directions (i.e. from P to A and return flow from B to T).

If only one direction of flow is required, when the four-way valve with chamber A or B blocked is used as three-way valve, the flow rate may be very small in severe cases.

Functional symbols	03
Characteristic curve	04
Characteristic limit	05
Component size	06-07

Features

- Right-angle directional valve operated by roller
- The roller can rotate 90°
- Interpolar conversion or deviation from the scanning direction by the curve control surface directly
- Radial direction (to 30° angle) is completely absorbed

Function description, sectional drawing

The WMR/U mechanical valve is direct operated directional spool valve with a roller/push rod controlled by a stopper or cam installed on the actuator.

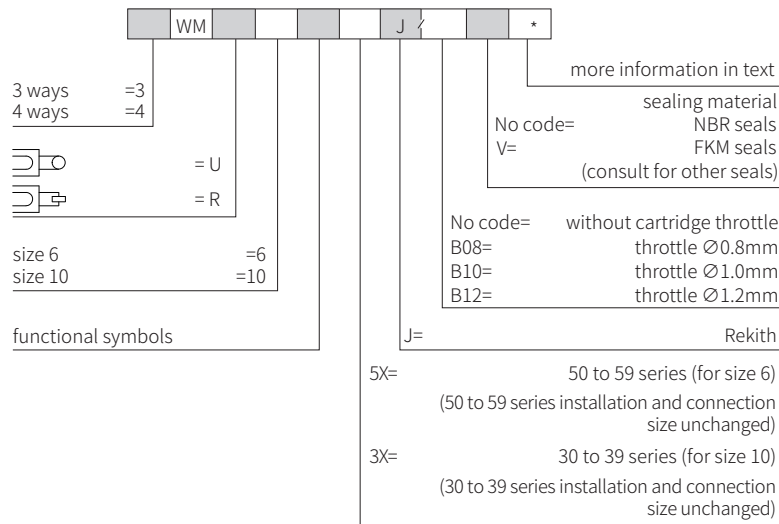

There are 3/2-way, 4/2-way and 4/3-way valves with variety of symbols. The rollers and push rods can be rotated by 90°, and the radial direction (30°) is fully absorbed.

The valve consists of valve body (1), roller/push rod (2), control spool (3) and reset spring (4). When no external force operation, the control spool (3) is held in the initial position (switching position b) by the reset spring (4). When the external force operate the roller/push rod, the control spool (3) is pushed back to the initial position by the reset spring.

Due to limitations of working conditions, the flow of the valve may exceed the value of the performance curve during the switching process. In this case, a throttle is required to install in the P chamber of the valve or in the oil circuit.

Component size	06

Features

- Solenoid operated direct type directional spool valve
- Wet-pin DC or AC solenoids

Any part of this brochure can not be reproduced, edited, copied and disseminated electronically in any way without authorization of Jiayite Hydraulics company. As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The WE4 directional valve is a solenoid operated directional spool valve. It controls the opening, closing and flow direction of the liquid flow.

The directional valve is mainly composed of valve body (1), one or two solenoid coils (2), control spool (3), and one or two reset springs (4). The control spool (3) is held in the middle or original position by means of the reset springs (4) (except for impulse spools) in the de-energized condition.

The control spool (3) is operated by wet pin solenoids (2). It must be taken that the pressure chamber of the solenoid is filled with oil to make sure the proper functioning.

The force of the solenoid (2) acts on the control spool (3) through the push rod (5) to push it from the middle position to the required end position. In this way, the fluid flow from P to A and B to T, or from P to B and A to T. When the solenoid (2) is de-energized, the control spool (3) will return to the neutral position under the action of the return spring (4). A manual emergency operation (6) is provided to operate the control spool (3) without solenoid.

Model WE4...2X/O...
This model is a directional valve with two switching positions and two solenoids but without detent and spring. There is no defined switching position during power failure.

Model WE4...2X/OF...
This model is a directional valve with two switching positions, two solenoids and a detent. Therefore, the relevant switching position is fixed and there is no require of continuous power supply.

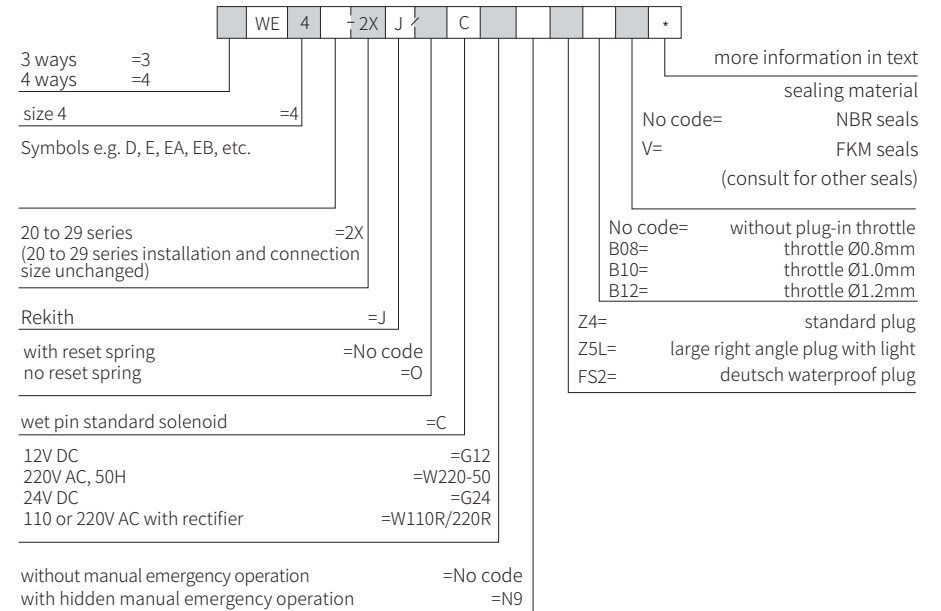

Note:
If two or more valves share one return tube, the spool may work abnormally because of pressure peak especially for the valves with detent. It is recommended to use a separate return tube for each valve or install a check valve in the tank pipe to prevent drain completely of the tank. If the installation condition is available, a back pressure valve can be installed. (Back pressure is about 2bar).

Plug-in throttle valve
If the flow exceeds the maximum power limit of the valve during the direction changing process under the given working conditions, it is recommended to insert a plug-in throttle into port P.

Characteristic limit

(Measured when using HLP46, $\vartheta_{oil}=40^{\circ}\text{C} \pm 5^{\circ}\text{C}$)

The performance limits shown are valid when using valves with flow in both directions (e.g. flow from P to A with return flow from B to T).

Because of the hydraulic force inside the valve, the allowable performance limit when oil flows in one direction (for example, from P to A and oil port B is blocked) is much lower!

Performance limits are measured using a solenoid coil at operating temperature and undervoltage 10%, without tank preinstalled.

Features

- Direct solenoid operated directional spool valve
- Wet pin DC or AC solenoids
- Plate connection

Function description, sectional drawing

The WE5 solenoid operated directional valve uses wet pin AC (or DC) solenoids to control different spool valve positions. This valve is mainly composed of valve body (1), one or two solenoids (2), spool (3) and one or two reset springs (4).

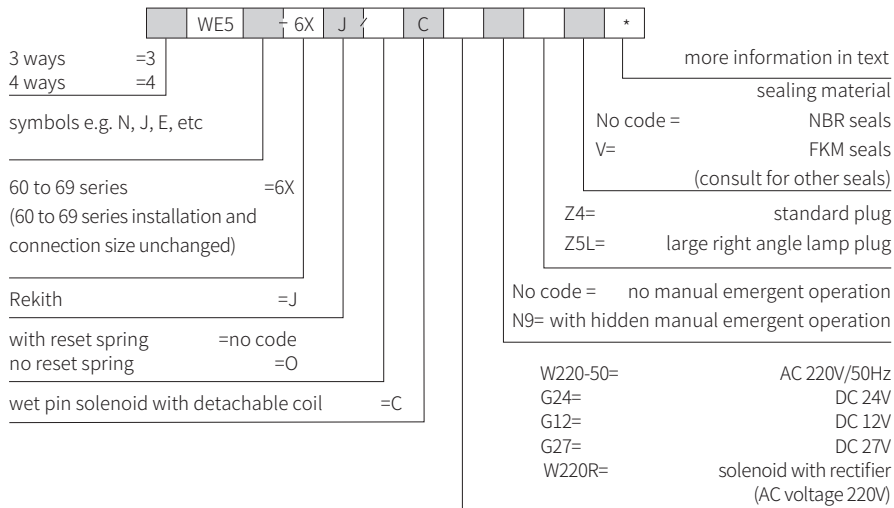

When the solenoid is de-energized, the spool valve is held in the middle or initial position by the spring (except for impulse valve). When the solenoid is energized, the force of the solenoid acts on the spool (3) through the push rod (5) to push it to the desired working position. Pushing the fault check button (6) can move the spool valve to check the working condition of the valve.

The WE5 valve adopts plate connection

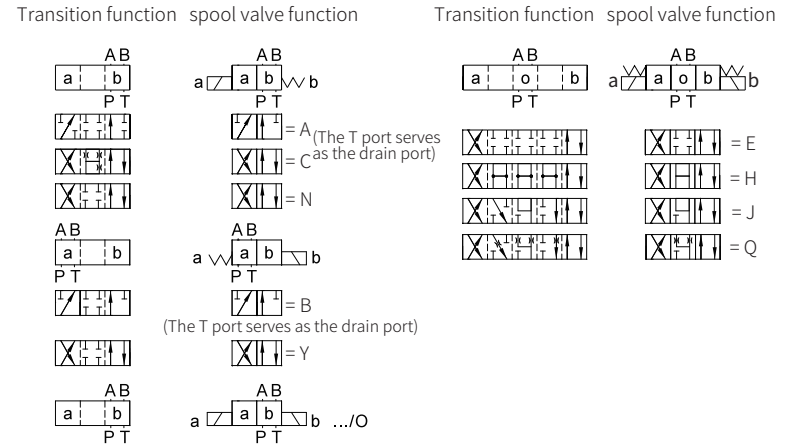

Due to the use of wet pin solenoids, this valve has the advantages of long service life, good heat dissipation performance, and short action time. DC solenoids have many advantages such as high commutation frequency, soft operating characteristics, insensitivity to overvoltage and low voltage response, and highly reliable operation. The valve is widely used in various hydraulic systems and as pilot valves for pressure valves.

Characteristic limit

The switching characteristics of the valve are related to the adhesion effect of the filter. To achieve the recommended flow value, it is recommended to use a 20um filter in the system. Due to the hydraulic force acting inside the valve affects the flow capacity of the valve. Therefore, different spool valve symbols have different power limits. In the case of only one channel, e.g. when the four-way valve with chamber A or B blocked is used as three-way valve, the power limit difference is significant.

Function description, sectional drawing

The WE6 directional valve is a directional spool valve operated by the solenoid. It controls the opening, closing, and flow direction of the liquid flow.

The directional valve is mainly composed of valve body (1), one or two solenoids (2), control spool (3), and one or two reset springs (4). The control spool (3) is held in the middle or original position by means of the reset spring (4) (except for impulse spools) in the de-energized condition.

The control spool (3) is operated by wet pin solenoids (2). The force of the solenoid (2) acts on the control spool (3) through the push rod (5) to push it from the stationary position to the terminal position. In this way, the hydraulic oil passes from P to A and from B to T, or from P to B and from A to T. After the solenoid (2) is de-energized, the reset spring (4) pushes the control spool (3) back to the middle position. As an optional emergency operation (6), it can change the position of the control spool (3) without solenoid.

Model WE6..6XJ/O (only for symbols A, C and D)

This model is a directional valve with two solenoids, two-position switch, without detent and no definite switching position in the power loss state. During power failure, there is no predetermined spool position.

Model WE6..6XJ/OF (impulse spool valve, only for symbols A, C and D)

This type refers to a two-position valve composed of two solenoids and a detent. The detent maintains the spool valve in its closest position and it is not required of continuous power supply.

Attention!

If two or more valves share one return tube, the spool may work abnormally because of pressure peak especially for the valves with detent. It is recommended to use a separate return tube for each valve.

Characteristic limit

(Measured when using HLP 46, $\vartheta_{oil} = 40^\circ\text{C} \pm 5^\circ\text{C}$)

Attention!

The given working limit is suitable for the use of flow in both directions (e. g. from P to A and return from B to T at the same time).

Due to the power of the fluid in the valve, the power limit allowed for only one flow direction might be significantly reduced (e.g. from P to A, while B is closed)!

The power limit is measured when the solenoid is at the operating temperature, at 10% below the standard voltage and without tank preloading.

As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The WE10 directional valve is a directional spool valve operated by solenoids. It controls the opening, closing, and flow direction of the liquid flow.

The directional valve is mainly composed of valve body (1), one or two solenoids (2), control spool (3), and one or two reset springs (4). Without power on, the control spool (3) is under the action of the reset spring (4), it is in the middle or original position (except impulse type). The control spool (3) is operated by the wet-pin solenoid (2).

To ensure proper function, the pressure chamber of the solenoid must be filled with oil. The force of solenoid (2) acts on control spool (3) and push it from the stationary position to the terminal position. In this way, the pressure oil flows from P to A and B to T, or from P to B and A to T. After the solenoid (2) powered off, the reset spring (4) push the control spool (3) towards the middle position. As an optional "emergency manual operation" (5), it can change the position of control spool (3) without solenoids.

Model 4WE10...3XJ

Model WE10... 3XJ/OF... (impulse spool valve), with detent

(Only for symbols A, C and D)

This model is a two-position directional valve with two solenoids and detents. In this way, the control spool can be held in any position and the solenoids do not need to be continuously energized.

Plug-in throttle valve (model 4WE10.../.../B...)

If the flow exceeds the power limit of the valve during the direction changing process under the given working conditions, it is recommended to insert a plug-in throttle into port P.

Model WE10... 3XJ/O... type

(Only for symbols A, C and D)

This model is a directional valve with two solenoids, two-position switch but no detent.

Regardless of its position, one of the solenoids must be powered on, and there is no exact switching position when power is off.

Model 4WE10...3XJ/OF... (Impulse spool valve)

H	-	-	-	3

Characteristic limit

(Measured when using HLP 46, $\vartheta_{oil} = 40^\circ\text{C} \pm 5^\circ\text{C}$)

The indicated limit applies to two flow directions (e.g. from P to A and simultaneous return oil flow from B to T).

Due to the effect of hydraulic power inside the valve, the allowable power will be significantly reduced when there is only one flow direction (e.g. from P to A, and the B oil port is closed).

The power limit is measured when the solenoid is at the operating temperature, at 10% below the standard voltage and without tank preloading.

Characteristic curve	05
Characteristic limit	05-06
Component size	07-08

Features

- Direct acting high-power solenoid operated directional spool valve
- Wet-pin DC or AC solenoids
- The solenoid coil can be rotated by 90°
- Replace the coil without releasing the oil
- Individual or central electrical connection, optional
- Optional manual operation

Any part of this brochure can not be reproduced, edited, copied and disseminated electronically in any way without authorization of Jiayite Hydraulics company. As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The valve mainly consists of valve body (1), one or two solenoids (2), control spool (3), and one or two reset springs (4).

When the solenoid is not energized, the control spool (3) is held in the neutral or starting position by the reset springs (4) (except for impulse spools). The action of the control spool (3) is achieved by wet-pin solenoid (2). When the solenoid (2) is energized, the force of the solenoid acts on the control spool (3) through the push rod (5) to push it from its stationary position to the working position. In this way, the oil passes from P to A and B to T, or from P to B and A to T.

When the solenoid is powered off, the control spool (3) is pushed back to its original position by the reset springs (4). At this time, the manual button (6) can be pushed to move the control spool.

4WE10E 5X/J type structural diagram

Model WE10...5XJ/O...:

This type is a two-position valve operated by two solenoids, but without reset spring and detent, and is no definite switching position in the power loss state. Its working position can only be determined when powered on, and the solenoids need to be powered on for a long time.

Model WE10...5XJ/OF...:

This type is also a two-position valve operated by two solenoids without reset spring but with detent, both working positions can be fixed. The spool is held in the fixed switching position without requirement of constant energization of the solenoids.

WE10...5XJ/OF...

Plug-in damper:

Due to working conditions limitations, it is possible that the flow exceeds the given value of the characteristics curve during the spool switching process. It is necessary to insert an plug-in throttle into port P of the valve.

Characteristic limit

(Measured when using HLP 46, $v_{oil} = 40^\circ\text{C} \pm 5^\circ\text{C}$)

The indicated limit applies to two flow directions (e.g. from P to A and simultaneous return oil flow from B to T).

Due to the effect of hydraulic power inside the valve, the allowable power will be significantly reduced when there is only one flow direction (e.g. from P to A, and the B oil port is closed).

The power limit is measured when the solenoid is at the operating temperature, at 10% below the standard voltage and without tank preloading.

Solenoid Operated Directional Valve with Emergency Handle

Model: 4WEMM6(10).../...

- ◆ Size 6 to 10
- ◆ Maximum working pressure 350 bar
- ◆ Maximum working flow rate 120 L/min

Contents

Function description, sectional drawing	02
Models and specifications	02
Technical parameters	03
Functional symbols	03
Component size	04-07

Features

- The opening, closing and direction of the flow controlled by the solenoid and manual
- Wet-pin solenoid with detachable coil
- The solenoid can rotate 90°
- Subplate mounting

Function description, sectional drawing

The WEMM directional valve is a directional spool valve operated by solenoid and control handle. It controls the opening, closing and flow direction of liquid flow.

It is mainly composed of valve body (1), one or two solenoids (2), valve spool (3), reset spring (4) and manual control device.

Solenoid operation:

When the solenoid is de-energized, the valve spool (3) is held in the middle or original position by means of the reset spring. The force of the solenoid (2) acts on the valve spool (3) to push it from the stationary position to the terminal position. In this way, the pressure oil flows from P to A and B to T, or from P to B and A to T. After the solenoid (2) is de-energized, the reset spring (4) pushes the valve spool (3) back to its original position.

Auxiliary handle operation:

When the solenoid is not energized, the valve spool (3) can be moved by operating the auxiliary handle. Turn the auxiliary handle (5) to the right so that the operating force acts on the valve spool (3) through the spindle (6), the ball valve core (7) and the guide sleeve (8) to move it to the left. When the auxiliary handle (5) returns to the zero position, the valve spool (3) returns to the original position under the action of the reset spring (9).

As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The valve is composed of valve body (1), valve spool (2), transition joint (or transition cover) (3), sensor (4), solenoid (5), and sensing rod (or transition spool) (6).

The valve spool is moved from the rest position to the required working position to realize the switching process by energizing or de-energizing solenoid. The fluid flows from P to A and B to T, or from P to B and A to T.

During the switching process, the signal is received through the proximity switch to feedback timely to the system whether the switching is in place and protect the system.

Features

- Directional valve operated by solenoid
- Control the opening and closing of the oil
- The manual emergency operation controls the movement of the control spool when solenoid de-energized

Function description, sectional drawing

The Z4WE6 isolating valve is solenoid operated directional spool valve. It controls the opening and closing of the oil.

The valve is composed of valve body (1), one or two solenoids (2), control spool (3) and 2 reset springs (4). In the de-energized condition, the control spool(3) is held in the neutral or initial position by reset spring (4), the control spool (3) is controlled by wet-pin solenoid (2). To ensure proper function, the pressure chamber of the solenoid must be filled with oil.

The force of the solenoid (2) via push rod (5) acts on control spool (3) and pushes it from the stationary position to the required position. Then port A1, A2, B1 and B2 can be either connected or disconnected. The port P and T always flow freely.

When the solenoid (2) is de-energised, the control spool (3) is returned to the neutral position via reset spring (4). The manual emergency operation controls the movement of the control spool when solenoid de-energized.

Characteristic limit	05
Component size	06-07

Features

- Direct operated directional spool valve
- Operating types:
Pneumatic (WP)
Hydraulic (WH)
- Subplate mounting
- Porting pattern to DIN 24340 form A and ISO4401

Function description, sectional drawing

The WH/WP are directional spool valves with fluid logic actuation. It is used to control the opening, closing and direction of the flow.

The valve mainly consists of valve body (1), one or two control pistons (2), valve spool (3), and one or two reset springs (4).

Model WH and WP

When there is no pressure oil in the control piston (2), the valve spool (3) is held in the middle or initial position by the reset spring (4). After the pressure oil acts on the control piston (2), the piston (2) pushes the valve spool (3) to move from the stationary position to the required position, thereby opening the required flow section. If the pressure oil is removed, the valve spool (3) is pushed back to the original position by the reset spring (4).

Model WH.../O and WP.../O (Only for symbols A, C, D)

The directional valve operated by hydraulic pressure has no definite switching position in its original state when operation without reset spring and detent.

Model WH.../OF and WP.../OF (Only for symbols A, C, D)

The the valve spool of the hydraulic pressure operated directional valve can be held in any switching position when operation with detent.

Plug-in throttle

Due to working conditions limitations, the flow rate may exceed the value of the performance curve during the switching process. Therefore, it is necessary to install a plug-in throttle in the channel P of the control valve.

If the pressure of the return oil (tank) increases, the minimum control pressure must be increased according to this curve.

Characteristic limit

Due to blockage, the working performance of this type of valve is related to the filtration accuracy. In order to obtain the given allowable flow value, it is recommended to use a full flow filtration of 25µm. The various forces inside the valve also affect its working limit. Therefore, for a four-way valve, the given flow value is the value under normal conditions when both flow channels are working (for example, P to A and simultaneously return from B to T). If only one direction of flow is needed, the A or B ports of the four-way valve is blocked and used as a three-way valve, the flow rate may be very small in severe cases

and ISO4401

Any part of this brochure can not be reproduced, edited, copied and disseminated electronically in any way without authorization of Jiayite Hydraulics company. As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The WHD valve is directional spool valve with fluid logic actuation, it controls the opening, closing and direction of the flow.

The valve is composed of valve body (1), main spool (2), one or two reset spring (3), and one or two position (4).

Model WHD...

In the initial state, the main spool (2) remains in the middle position under the action of two reset springs (3). If external signal oil enters through port A, the oil pushes the left position (4) to the right, thus driving the main spool (2) to the right. Removing the control oil, the main spool (2) returns to the middle position under the right spring force.

If external signal oil enters through port B, the oil pushes the right position (4) to the left, thus driving the main spool (2) to the left. Removing the control oil, the main spool (2) returns to the middle position under the left spring force.

Model WHD.../O (Only for symbols A, C, D)

This model is a hydraulic operated direction valve. If using actuation elements without reset springs and without detent, there is no defined spool position in initial condition.

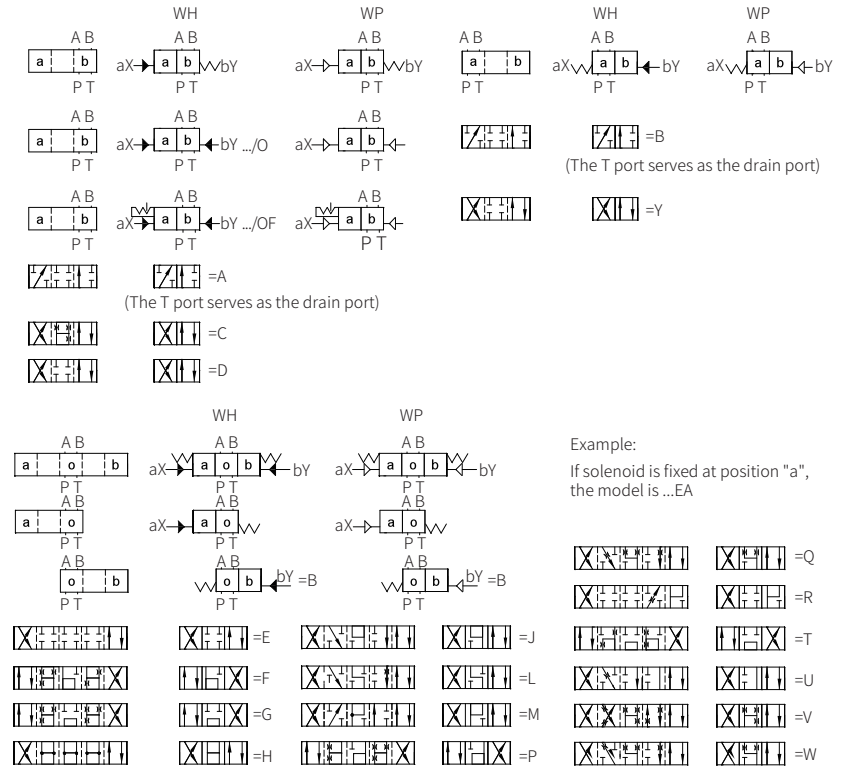

Model WHD.../OF (Only for symbols A, C, D)

This model is a hydraulic operated direction valve. When actuation elements with detent, the spool position can be locked.

Plug-in throttle

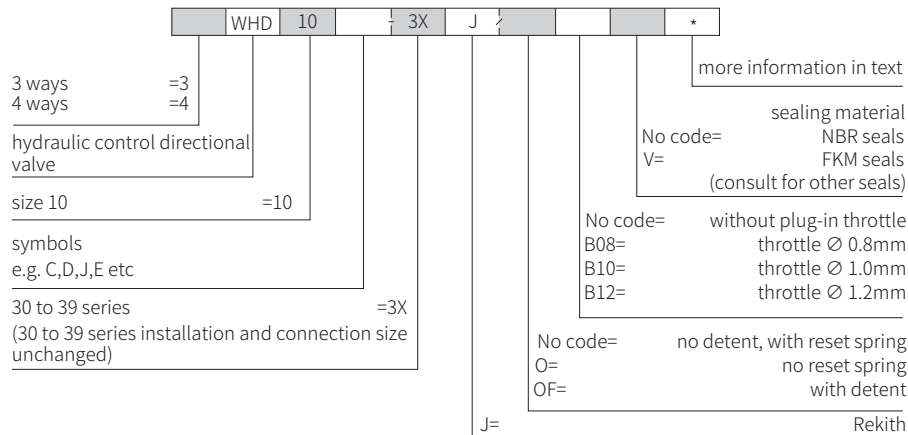

Due to the limitation of the working conditions, the flow may exceed the value of the performance curve during switching process, so it is necessary to install a plug-in throttle into channel P.

Functional symbols

Example:
If solenoid is fixed at position "a", the model is ...EA

Characteristic limit

Because of adhesive effect, the switching function of the valves depends on the filtration. In order to achieve the specified admissible flow values, we suggest full flow filtration with 25um. The flow force acting within the valves also affect the flow performance. With 4 way valves the specified flow data thus apply to normal operation with 2 volume flow directions(e.g. from P to A and at the same time return flow from B to T)

If only one flow direction is available, when 4-way valve is used as a 3-way valve by blocking port A or B, the flow can be significantly smaller in critical cases.

Features

- Direct operated solenoid directional poppet valve
- Closed port without leakage
- Switching smoothly even in high-pressure state long periods

0179

Function description, sectional drawing

General:

The M-SEW6 directional valve is solenoid operated directional seat valve. It is used to control the opening, closing and flow direction of fluid.

The valve is mainly composed of valve body (1), solenoid (2), hardened valve system (3) and ball (4) as the closing element.

Basic functions:

In the initial position, the ball (4) is pressed into the valve seat by the spring (9) and by the solenoid (2) when in the switching position. The force of the solenoid (2) acts on the actuating push rod (8) which is sealed on both sides through the lever (6) and the ball (7). The chamber between the two sealing elements is connected to oil port P. Therefore, the valve system is pressure compensated based on the actuating force (solenoid or reset spring). In this way, the valve can be used up to 630bar.

Note:

The 3/2-way directional seat valve has "negative cover" function. Therefore, port T must be always connected. That means the ports P-A-T are connected with each other during the switching process (from the starting of the opening of one valve seat to the closing of the other valve seat). But this process is completed in a very short time, so it is irrelevant in almost all applications. The manual emergency operation (10) allows the valve to be switched without solenoid energized. It must ensure that the specified maximum flow is not exceeded! If necessary, a throttle can be used to limit the flow.

Switching position	P and A connected, T blocked

Function description, sectional drawing

To install a sandwich plate, the plus-1 plate under the 3/2 directional seat valve, the function of a 4/2-way directional seat valve can be realized.

Function of plus-1 plate:

Initial position:

The main valve does not work. The spring (9) holds the ball (4.1) on the valve seat (11). The port P is blocked, and port A is connected to port T. In addition, there is a pilot line connected from A to the large area of the control spool (12), which is unloaded to the tank. The pressure provided by port P will push the ball (13) to the valve seat (14). Now, P is connected to B, and A to T.

Model M-4SEW6D...3XJ/

Transition position:

When the main valve is operated, the spool (4.2) moves against the spring (9) and is pressed into the valve seat (15). During this process, port T will be closed, P, A and B are connected to each other within a short time.

Switching position:

The port P is connected to A. The pump pressure acts via A on the large area of the control spool (12), the ball (13) is pressed into the valve seat (16). Therefore, B is connected to T and P to A. The balls (13) in the plus-1 plate has "positive cover".

Note:

In order to avoid pressure intensification when the single rod cylinders used, the annular area of the cylinder must be connected to A.

The seat valve with plus-1 plate as below:

Cartridge throttle

Due to the working conditions limitations, it may occur that the flow exceeds the performance limit of the valve during the switching process, then the use of a throttle is required.

Example:

- Accumulator operation
- Used as a pilot valve with internal pilot oil supply

3/2-way poppet valve

The throttle is inserted into the port P of the directional valve.

4/2-way poppet valve

The throttle is inserted into the oil port P of the plus-1 plate.

Cartridge check valve

The cartridge check valve allows free flow from P to A and leak-free closure from A to P.

3/2-way poppet valve

The cartridge check valve is inserted into the oil port P of the directional valve.

4/2-way poppet valve

The cartridge check valve is inserted into port P of the plus-1 plate.

Characteristic limit

	Functional symbol	comment	Working pressure bar				Flow L/min
			P	A	B	T	
Two-way circuit		Oil port pressure $P \geq T$	420/630			100	25
			420/630			100	25
Three-way circuit		Oil port pressure $P \geq A \geq T$	420/630	420/630		100	25
			420/630	420/630		100	25
Two-way circuit (only for unloading function)		Pressure must be maintained in port A before switching from the original position to the switching position. Oil port pressure $A \geq T$		420/630		100	25
		Oil port pressure $A \geq T$		420/630		100	25
Four-way circuit (flow only in the direction of the arrow)		Single poppet valve (symbol "U") with plus-1 plate $P \geq A \geq B \geq T$	420/630	420/630	420/630	100	25
		Double poppet valve (symbol "C") with plus-1 plate $P \geq A \geq B \geq T$	420/630	420/630	420/630	100	25

Note:

- In order to operate the valve safely or keep it in the switching position, the oil port pressure $P \geq A \geq T$ (based on the structure).
 - The ports P, A and T (3/2-way valve), and ports P, A, B and T (4/2-way valve) are configured according to their functions and must not be blocked or used in other ways. Liquid flow is only allowed in the direction of the arrow.
 - When using the plus-1 plate (4/2-way valve), the following data must be met: $P_{min}=8\text{bar}$; $Q>3\text{ L/min}$
 - The specified maximum flow should not be exceeded.
- The characteristic limit is measured when the solenoid is at operating temperature, at 10% below the standard voltage and without tank preloading.

Features

- Direct operated solenoid directional poppet valve
- Closed port without leakage
- Switching flexibility even in high-pressure state long periods
- Air-gap DC solenoid with detachable coils (AC voltage available after rectification)
- The solenoid coil can be rotated by 90°
- Individual electrical connection

Function description, sectional drawing

3/2-way directional seat valve

General:

The M-SEW10 directional valve is solenoid operated poppet valve. It controls the opening, closing and direction of the fluid.

The valve is mainly composed of valve body (1), solenoid (2), hardened valve system (3) and ball (4) as the closing element. The manual emergency operation (5) can be control the valve when the solenoid is not energized.

Basic function:

In the initial position, the spool (4) is pressed into the valve seat by the spring (9) and by the solenoid when in the switching position. The force of the solenoid (2) is applied to the actuating push rod (8) which is sealed on both sides through the lever (6) and the ball (7). The chamber between the two sealing elements is connected to the port P. Therefore, the valve system (3) is pressure compensated based on the actuating force (solenoid or spring). In this way, the valve can be used up to 630bar.

Note:

- The 3/2-way poppet directional valve has "negative cover function". Therefore, the port T must be always connected. That means the ports P-A-T are connected to each during the switching process (from the starting of the opening of one valve seat to the closing of the other valve seat). But this process is completed in a very short time, so it is irrelevant in almost all applications.
- It must ensure that the specified maximum flow does not exceeded the performance limit of the valve.
- If necessary, the cartridge throttle can be installed to limit the flow.

Function description, sectional drawing

4/2-way poppet directional valve

Initial position: When the solenoid is not energized, the force of the spring (6) keeps the ball spool (12) on the left valve seat (8). The port P is connected with A. The pump pressure oil acts on the large area of the control piston (15) through the control line from port A. The steel ball (13) is pushed to the other side of the valve seat (14), so the oil port P is connected to A and B to T.

Switching position: After the solenoid is energized, the oil port A is connected to T. In addition, the control line from the oil port A acts on the large area of the control piston (15) to unload to the tank. The pressure oil provided from the oil port P pushes the steel ball (13) to the valve seat (14). At this time, the oil port P is connected to B.

The seat valve with plus-1 plate as below:

Cartridge throttle

Due to the working conditions limitations, it may occur that the flow exceeds the performance limit of the valve during the switching process, then the use of a throttle is required.

Example:

- Accumulator operation
- Used as a pilot valve with internal pilot oil supply

3/2-way poppet valve

The throttle is inserted into the port P of the directional valve.

4/2-way poppet valve

The throttle is inserted into the oil port P of the plus-1 plate.

Cartridge check valve

The cartridge check valve allows free flow from P to A and leak-free closure from A to P.

3/2-way poppet valve

The cartridge check valve is inserted into the oil port P of the directional valve.

4/2-way poppet valve

The cartridge check valve is inserted into port P of the plus-1 plate.

Features

- Direct operated solenoid directional poppet valve
- Closed port without leakage
- Switching flexibility even in high-pressure state long periods
- Wet-pin DC solenoid with detachable coil (AC voltage available via rectifier)
- The coil can be rotated by 90°
- Replace the coil without opening the pressure chamber
- Individual electrical connection

Function description, sectional view

General:

The M-SED6 directional valve is solenoid operated directional poppet valve, it is used to control the opening, closing, and flow direction of oil.

The valve mainly consists of the valve body (1), solenoid (2) and closing element (4). The manual emergency operation (6) can control the valve when the solenoid is not energized.

01

Basic functions:

The initial position of the valve is determined by the setting of the spring (5). When the power is cut off, the "UK" type valve is opened, while the "CK" type valve is closed. The valve chamber (3) behind the closing element (4) is connected to the port P and sealed against the port T. Therefore, the valve is in a pressure balanced state related to the operating force (solenoid and the spring).

Due to the special closing element (4), the valve can work when the working pressure of ports P, A, and T up to 350bar, and flow in both directions (see symbols)!

In the initial position, the closing element (4) is pressed onto the valve seat (11) by the spring (5), and in the switching position, the solenoid (2) pushes it towards the valve seat (7). That results in a leak-free seal.

Model M-3SED6UK...1XJ/

Symbol "UK"

Model M-3SED6CK...1XJ/

Symbol "CK"

Function description, sectional view

To install a sandwich plate, the plus-1 plate under the 3/2-way directional poppet valve, then it can be used as a 4/2-way directional poppet valve.

Function of plus-1 plate:

Initial position:

The main valve does not work. The spring (5) holds the closing member (4) on the valve seat (11). The port P is closed, and port A is connected to port T. In addition, there is a control line over a large area from A to the control piston (8), which unloads to the tank. The pressure oil provided by the oil port P pushes the ball (9) to the valve seat (10), then P is connected to B and A to T.

Model M-4SED6Y...1XJ/

Transition position:

When the main valve is operated, the closing element (4) overcomes the force of the spring (5) and presses on the valve seat (7). Therefore, the oil port T is closed, the ports P, A and B are connected to each other within a short time.

Switching position:

The port P is connected to A. The pressure oil from the pump acts on the large area of the control piston (8) through A, and the ball (9) is pushed to the valve seat (12). Therefore, B is connected to T and P to A.

The ball (9) in the plus-1 plate has a "positive cover switching function". In order to avoid a sudden increase of the pressure when using the single rod cylinder, the annular area of the cylinder must be connected to A.

Because of the using of the plus -1 plate and the different arrangement of the valve seat, the following situations may occur.

Symbol "D":

Symbol "Y":

Cartridge throttle

Due to the working conditions limitations, it may occur that the flow exceeds the performance limit of the valve during the switching process, then the use of a throttle is required.

Example:

- Accumulator operation
- Used as a pilot valve with internal pilot oil supply

3/2-way poppet valve

The throttle is inserted into the port P of the directional valve.

4/2-way poppet valve

The throttle is inserted into the oil port P of the plus-1 plate.

Cartridge check valve

The cartridge check valve allows free flow from P to A and leak-free closure from A to P.

3/2-way poppet valve

The cartridge check valve is inserted into the oil port P of the directional valve.

4/2-way poppet valve

The cartridge check valve is inserted into port P of the plus-1 plate.

Features

- Direct operated solenoid directional poppet valve
- Closed port without leakage
- Switching flexibility even in high-pressure state long periods
- Wet-pin DC solenoid with detachable coil(AC voltage available via rectifier)
- The solenoid coil can be rotated 90°
- Individual electrical connection
- Replacing the coil without opening the pressure chamber

Function description, sectional drawing

3/2-way directional poppet valve

General:

The M-SED10 directional valve is solenoid operated directional poppet valve, it is used to control the opening, closing and direction of oil.

The valve mainly consists of the valve body (1), solenoid (2) and closing element (4).

The manual emergency operation (6) can control the valve when the solenoid is not energized.

Basic functions:

The initial position of the valve is determined by the setting of the spring (5). When the power is cut off, the "UK" type valve is opened, while the "CK" type valve is closed. The valve chamber (3) behind the closing element (4) is connected to the port P and sealed against the port T. Therefore, the valve is in a pressure balanced state related to the operating force (solenoid and spring).

Due to the special closing element (4), the valve can work when the working pressures of ports P, A and T up to 350bar, and the flow in both directions (see symbols)! In the initial position, the closing element (4) is pressed onto the valve seat (11) by the spring (5), and in the switching position, the solenoid (2) pushes it towards the valve seat (7). That results in a leak-free seal.

Symbol "UK"

Symbol "CK"

01

Function description, sectional drawing

4/2-way directional poppet valve

To install a sandwich plate, the plus-1 plate under the 3/2-way directional poppet valve, then it can be used as a 4/2-way directional poppet valve.

Function of plus-1 plate:

Initial position:

The main valve does not work. The spring (5) holds the closing element (4) on the valve seat (11). The port P is closed, and port A is connected to port T. In addition, there is a control line over a large area from A to the control piston (8), which unloads to the tank. The pressure oil provided by the oil port P pushes the ball (9) to the valve seat (10), then P is connected to B and A to T.

Transition position:

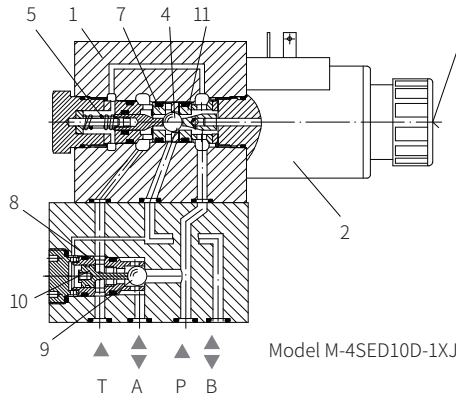

When the main valve is operated, the closing element (4) overcomes the force of the spring (5) and presses on the valve seat (7). Therefore, the oil

port T is closed, the ports P, A and B are connected to each other within a short time.

Switching position:

The port P is connected to A. The pressure oil from the pump acts on the large area of the control piston (8) through A, and the ball (9) is pushed to the valve seat (12). Therefore, B is connected to T and P to A. The ball (9) in the plus-1 plate has a "positive covering switching function". In order to avoid a sudden increase in pressure when using a single rod cylinder, the annular area of the cylinder must be connected to A.

Because of the using of the plus-1 plate and the different arrangement of the valve seat, the following situations may occur.

Model M-4SED10D-1XJ/

Symbol "D": a hydraulic symbol for a 4/2-way valve with a plus-1 plate. Port P is connected to A, and B is connected to T and P to A.

Symbol "Y": a hydraulic symbol for a 4/2-way valve with a plus-1 plate. Port P is connected to B, and A is connected to T and P to A.

01

Cartridge throttle

Due to the working conditions limitations, it may occur that the flow exceeds the performance limit of the valve during the switching process, then the use of a throttle is required.

Example:

- Accumulator operation
- Used as a pilot valve with internal pilot oil supply

3/2-way poppet valve

The throttle is inserted into the port P of the directional valve.

4/2-way poppet valve

The throttle is inserted into the oil port P of the plus-1 plate.

Cartridge check valve

The cartridge check valve allows free flow from P to A and leak-free closure from A to P.

3/2-way poppet valve

The cartridge check valve is inserted into the oil port P of the directional valve.

4/2-way poppet valve

The cartridge check valve is inserted into port P of the plus-1 plate.

Hydraulic or Electro-hydraulic Directional Valve

Model: WEH/WH...5XJ

- ◆ Size 10~32
- ◆ Maximum working pressure 350 bar
- ◆ Maximum working flow 1100 L/min

Contents

Function description, sectional drawing	02 - 04
Models and specifications	05
Functional symbols	06-08
Technical parameters	09-10
Characteristic curve	11-13
Characteristic limit	11-13
Switching time adjustment, pressure reducing valve and pre-load valve	14
Component size	15-20

Features

- Mainly used to control the opening, closing and direction of liquid flow
- Electro-hydraulic operation (WEH)
- Hydraulic operation (WH)
- Subplate mounting
- The mounting surface according to DIN24340 form A and ISO4401
- Spring or hydraulic centered
- Spring or hydraulic return to initial position
- Wet-pin DC or AC solenoid
- Optional manual emergency operation
- Individual or central electrical connection
- Optional switching time adjustment
- Optional pre-load valve in port P of the main valve
- Auxiliary component, optional
- Stroke adjustment of main spool
- Stroke adjustment or end position sensor
- Inductive or mechanical limit switch (proximity type) of the main spool

Function description, sectional drawing

Directional valve model WEH

The WEH directional valve is a directional spool valve with electro-hydraulic operation. It is used to control the opening, closing and direction of the liquid flow. The valve mainly consists of valve body (1), main control spool (2), main valve with one or two reset springs (3.1) and (3.2), pilot valve (4) with one or two solenoids "a" (5.1) and "b" (5.2). The main control spool is held in the neutral or initial position by the springs or pressure. For the valve with spring-centered, the two spring chambers (6) and (8) are connected to the oil tank through the pilot valve in the initial position. The pilot valve (4) is supplied with oil through the control line (7). The control oil can be supplied internally or externally (externally via port X). The main control spool (2) is hydraulically operated by the pilot valve (4). Due to the operating of the pilot valve on one end of the main control spool, the spool moves to the operation position, then the valve opens in the operation direction and the fluid flows from P to A and B to T or P to B and A to T. The control oil can be drained internally or externally. An optional manual emergency operation (9) can move the control spool (10) in the pilot valve (4) when the solenoid is not energized.

Directional valve model 4WEH.

Model 4WH...

Directional valve model WH

The WH directional valve is a hydraulically operated directional spool valve. It is used to control the opening, closing and direction of liquid flow. The valve mainly consists of valve body (1), main control spool (2), one or two reset springs (3.1) and (3.2) with spring centered or spring return functions, and control cover (11). The main control spool is operated by hydraulic directly. The spool is held in the neutral or initial position by springs or hydraulic pressure. The control oil is supplied and drained externally. For the 4/3-way valve with spool spring centered, the main control spool (2) is held in the neutral position by two centered springs. The two spring chambers (6, 8) are connected to the oil ports X and Y through the control cover (11). When one end of the main control spool (2) is pressurized, the spool moves to the working position, thereby connecting the corresponding oil circuit.

Function description, sectional drawing

4/3-way directional valve with hydraulic centered of main valve, model WEH..H/

In this structure, the pressure oil acts on both end surfaces of the main control spool (2). The centering sleeve (10) locates the main control spool (2) and keeps it in the middle position. If one end of the main control spool (2) is unloaded, the main control spool (2) moves to the working position under the pressure from the other end, thereby changing the direction of the oil flow. The unloaded control spool face displaces the returning pilot oil into port Y externally through the pilot valve (4). The oil is drained internal from port L to the tank directly.

Notice:

When using a 4/3-way valve with pressure centered in the main spool which exceeds the given performance limits, a higher pilot pressure is required. Therefore, if the pressure is 35MPa and the flow is 300L/min in the circuit, the pilot pressure of 1.6MPa is required. The maximum flow of the valve only depends on the acceptable pressure drop through the valve.

- 1)The given flow value can be achieved when the minimum pilot pressure of 1.2MPa exists.
- 2) The given flow value is limiting the value at which the reset spring can return the valve when the pilot pressure decreases.

- 1) The given flow value can be achieved when the minimum pilot pressure of 1.0MPa exists.
- 2) The given flow value is limiting the value at which the reset spring can return the valve when the pilot pressure decreases.

Notice:
When using a 4/3-way valve with pressure centered in the main spool which exceeds the given performance limits, a higher pilot pressure is required. Therefore, if the pressure is 35MPa and the flow is 300L/min in the circuit, the pilot pressure of 1.5MPa is required. The maximum flow of the valve only depends on the acceptable pressure drop through the valve.

Switching time adjustment, pressure reducing valve and pre-load valve

Switching time adjustment

To control the switching time of the main valve (1), a double throttle check valve (12) is installed between the pilot valve and the main valve. Conversion from meter-in control (13) to meter-out control (14): Remove the pilot valve (4) but retain the O-ring support plate (15), turn the throttle check valve around its longitudinal axis and reassemble it on the mounting surface, install the pilot valve (4). Tightening torque $M_A=9Nm$ for fixing screw (16).

Model 4WEH.../S or S2

Pressure reducing valve "D3"

The pressure reducing valve (17) must be used if the pilot pressure exceeds 25MPa. The secondary pressure should be maintained at 4.5MPa. When using the pressure reducing valve D3, it must install a plug-in throttle B10 in port P of the pilot valve. Tightening torque $M_A=9Nm$ for fixing screw (16).

Model 4WEH.../.../D3

Pre-load valve

In the valve with pressureless bypass and internal pilot oil supply, a pre-load valve (18) is installed in port P of the main valve to built up the minimum pilot pressure.

Hydraulic or Electro-hydraulic Directional Valve

Model: WEH/WH...4X/6X/7XJ

- ◆ Size 10~32
- ◆ Maximum working pressure 350 bar
- ◆ Maximum working flow 1100 L/min

Contents

Function description, sectional drawing	02 - 04
Models and specifications	05
Functional symbols	06-08
Technical parameters	09-10
Characteristic curve	11-15
Characteristic limit	11-15
Switching time adjustment, pressure reducing valve and pre-load valve	16
Component size	17-25

Features

- Mainly used to control the opening, closing and direction of liquid flow
- Electro-hydraulic operation (WEH)
- Hydraulic operation (WH)
- Subplate mounting
- The mounting surface according to DIN24340 form A and ISO4401
- Spring or hydraulic centered
- Spring or hydraulic return to initial position
- Wet-pin DC or AC solenoid
- Optional manual emergency operation
- Individual or central electrical connection
- Optional switching time adjustment
- Optional pre-load valve in port P of the main valve
- Auxiliary component, optional
 - Stroke adjustment of main spool
 - Stroke adjustment or end position sensor
 - Inductive or mechanical limit switch (proximity type) of the main spool

Function description, sectional drawing

Directional valve model WEH

The WEH directional valve is a directional spool valve with electro-hydraulic operation. It is used to control the opening, closing and direction of the liquid flow. The valve mainly consists of valve body (1), main control spool (2), main valve with one or two reset springs (3.1) and (3.2), pilot valve (4) with one or two solenoids "a" (5.1) and "b" (5.2). The main control spool is held in the neutral or initial position by the springs or pressure. For the valve with spring-centered, the two spring chambers (6) and (8) are connected to the oil tank through the pilot valve in the initial position. The pilot valve (4) is supplied with oil through the control line (7). The control oil can be supplied internally or externally (externally via port X). The main control spool (2) is hydraulically operated by the pilot valve (4). Due to the operating of the pilot valve on one end of the main control spool, the spool moves to the operation position, then the valve opens in the operation direction and the fluid flows from P to A and B to T or P to B and A to T. The control oil can be drained internally or externally. An optional manual emergency operation (9) can move the control spool (10) in the pilot valve (4) when the solenoid is not energized.

**Directional valve model WH**

The WH directional valve is a hydraulically operated directional spool valve. It is used to control the opening, closing and direction of liquid flow. The valve mainly consists of valve body (1), main control spool (2), one or two reset springs (3.1) and (3.2) with spring centered or spring return functions, and control cover (11). The main control spool is operated by hydraulic directly. The spool is held in the neutral or initial position by springs or hydraulic pressure. The control oil is supplied and drained externally. For the 4/3-way valve with spool spring centered, the main control spool (2) is held in the neutral position by two centered springs. The two spring chambers (6, 8) are connected to the oil ports X and Y through the control cover (11). When one end of the main control spool (2) is pressurized, the spool moves to the working position, thereby connecting the corresponding oil circuit.

Function description, sectional drawing

4/3-way directional valve with hydraulic centered of main valve, model WEH..H/

In this structure, the pressure oil acts on both end surfaces of the main control spool (2). The centering sleeve (10) locates the main control spool (2) and keeps it in the middle position. If one end of the main control spool (2) is unloaded, the main control spool (2) moves to the working position under the pressure from the other end, thereby changing the direction of the oil flow. The unloaded control spool face displaces the returning pilot oil into port Y externally through the pilot valve (4). The oil is drained internal from port L to the tank directly.

**Pilot oil supply****● Model WEH10**

◆ Conversion between internal supply and external supply:

The channel P on the top of the main valve body with M6 screw (3) is external supply, and is internal supply when M6 screw (3) is dismantled.

◆ Conversion between internal drain and external drain:

Removing the plug (1) and installing M6 screw (2) is external drain, dismantling M6 screw (2) is internal drain.

**● Model WEH16**

◆ Conversion between internal supply and external supply:

The channel P on the bottom of the main valve with M6 screw (8) is external supply, and is internal supply when M6 screw (8) is dismantled.

◆ Conversion between internal drain and external drain:

The channel T on the top of the main valve with M6 screw (7) is external drain, and is internal drain when M6 screw (7) is dismantled.

Function description, sectional drawing

Pilot oil supply

● Model WEH25

- ◆ Conversion between internal supply and external supply:

The channel P on the top of the main valve with M6 screw (9) is external supply, and is internal supply when M6 screw (9) dismantled.

- ◆ Conversion between internal drain and external drain:

The channel T on the top of the main valve with M6 screw (10) is external drain, and is internal drain when M6 screw (10) dismantled.

Spool	Allowable flow of 2-position and 3-position valves (L/min)		
	Working pressure(MPa)		
	20	25	31.5
E, J, L, M, Q, R, U, V, W C, D, K, Z, Y	160		
H	160	150	120
G, T	160	160	140
F, P	160	140	120

Notice:

The given characteristic limits are suitable for the use of flow in both directions (e. g. from P to A and return from B to T at the same time).

Due to the power of the fluid in the valve, the characteristic limit allowed for only one flow direction might be significantly reduced (e.g. from P to A, while B is closed)!

The characteristic limits are measured when the solenoid is at the operating temperature, at 10% below the standard voltage and without tank preloading.

Characteristic curve

Model 4WEH16...(Measured at $\vartheta_{oil}=41mm^2/s$ and $t=50^\circ C$)

S	4	4	4	-	8

Characteristic limit

Model 4WEH16...(Measured at $\vartheta_{oil}=41mm^2/s$ and $t=50^\circ C$)

Allowable flow of 2-position valve (L/min)					
Spool	Working pressure(MPa)				
	7	14	21	28	35
Main valve spring return ¹⁾					
C, D, K, Z, Y	300	300	300	300	300
Main valve spring return ²⁾					
C	300	300	300	300	300
D, Y	300	270	260	250	230
K	300	250	240	230	210
Z	300	260	190	180	160
Main valve hydraulic return					
HC, HD, HK	300	300	300	300	300
HZ, HY	300	300	300	300	300

- 1) The given flow value can be achieved when the minimum pilot pressure of 1.2MPa exists.
- 2) The given flow value is limiting the value at which the reset spring can return the valve when the pilot pressure decreases.

Spool	Allowable flow of 3-position valve (L/min)					with pre-load valve and X port internal supply
	Working pressure(MPa)					
	7	14	21	28	35	
Main valve spring return ¹⁾						
E, H, J, L, MQ, U, W, R	300	300	300	300	300	Spools F, G, H P and S in general
F, P	300	250	180	170	150	
G, T	300	300	240	210	190	
S	300	300	300	250	220	
V	300	250	210	200	180	
Pressure centered (minimum pilot pressure 1.6MPa)						
All spools	300	300	300	300	300	Spool approx. to 160L/min

Notice:
When using a 4/3-way valve with pressure centered in the main spool which exceeds the given performance limits, a higher pilot pressure is required. Therefore, if the pressure is 35MPa and the flow is 300L/min in the circuit, the pilot pressure of 1.6MPa is required.
The maximum flow of the valve only depends on the acceptable pressure drop through the valve.

Characteristic curve

- 2) The given flow value is limiting the value at which the reset spring can return the valve when the pilot pressure decreases.

Switching time adjustment, pressure reducing valve and pre-load valve

Switching time adjustment

To control the switching time of the main valve (1), a double throttle check valve (12) is installed between the pilot valve and the main valve.

Conversion from meter-in control (13) to meter-out control (14):

Remove the pilot valve (4) but retain the O-ring support plate (15), turn the throttle check valve around its longitudinal axis and reassemble it on the mounting surface, install the pilot valve (4). Tightening torque $M_A=9Nm$ for fixing screw (16).

Model 4WEH.../S or S2

Pressure reducing valve "D3"

The pressure reducing valve (17) must be used if the pilot pressure exceeds 25MPa. The secondary pressure should be maintained at 4.5MPa. When using the pressure reducing valve D3, it must install a plug-in throttle B10 in port P of the pilot valve.

Tightening torque $M_A=9Nm$ for fixing screw (16).

Model 4WEH.../.../D3

Pre-load valve (not for size 10)

In the valve with pressureless bypass and internal pilot oil supply, a pre-load valve (18) is installed in port P of the main valve to built up the minimum pilot pressure.

As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The GD-WE6 directional control valve is a directional spool valve operated by an explosion-proof solenoid, it is used to control the opening, closing and flow direction of the liquid flow.

This directional control valve mainly includes valve body (1), one or two explosion-proof solenoids (2), control spool (3) and one or two reset springs (4).

In the non-energized condition, the control spool (3) is held in the middle or initial position by the reset spring (4). The control spool (3) is operated by the wet-pin explosion-proof solenoid (2). To ensure the proper functioning, the pressure chamber of the solenoid must be filled with oil.

The force of the explosion-proof solenoid (2) acts on the control spool (3) through the push rod (5) to push from the stationary position to the required position. In this way, the oil flows freely from P to A and B to T, or P to B and A to T. When the explosion-proof solenoid (2) is powered off, the control spool (3) is pushed back to the initial position by the reset spring (4).

Characteristic limit

(Measured when using HLP46, $\vartheta_{oil} = -40^{\circ}\text{C} \pm 5^{\circ}\text{C}$)

Attention!

The given working limit is suitable for the use of flow in both directions (e. g. from P to A and return from B to T at the same time).

Due to the power of the fluid in the valve, the power limit allowed for only one flow direction might be significantly reduced (e.g. from P to A, while B is closed)!

The power limit is measured when the solenoid is at the operating temperature, at 10% below the standard voltage and without tank preloading.

H	-	-	-	-	3

Characteristic limit

DC voltage (Measured when using HLP46, $\vartheta_{oil}=40^{\circ}\text{C} \pm 5^{\circ}\text{C}$)

The indicated switching power limit applies to two flow directions (e.g. from P to A and simultaneous return oil flow from B to T).

Due to the effect of hydraulic power inside the valve, the allowable power will be significantly reduced when there is only one flow direction (e.g. from P to A, and the B oil port is closed).

The switching power limit is measured when the solenoid is at the operating temperature, at 10% below the standard voltage and without tank preloading.

Function description, sectional drawing

The GD-4WEMM directional valve is a directional spool valve operated by explosion-proof solenoid and control handle. It controls the opening, closing and flow direction of liquid flow.

It is mainly composed of valve body (1), one or two solenoids (2), valve spool (3), reset spring (4) and manual control device.

Solenoid operation:

When the solenoid is de-energized, the valve spool (3) is held in the neutral or original position by means of the reset spring. The force of the solenoid (2) acts on the valve spool (3) to push it from the stationary position to the terminal position. In this way, the pressure oil flows from P to A and B to T, or from P to B and A to T. After the solenoid (2) is de-energized, the reset spring (4) pushes the valve spool (3) back to its original position.

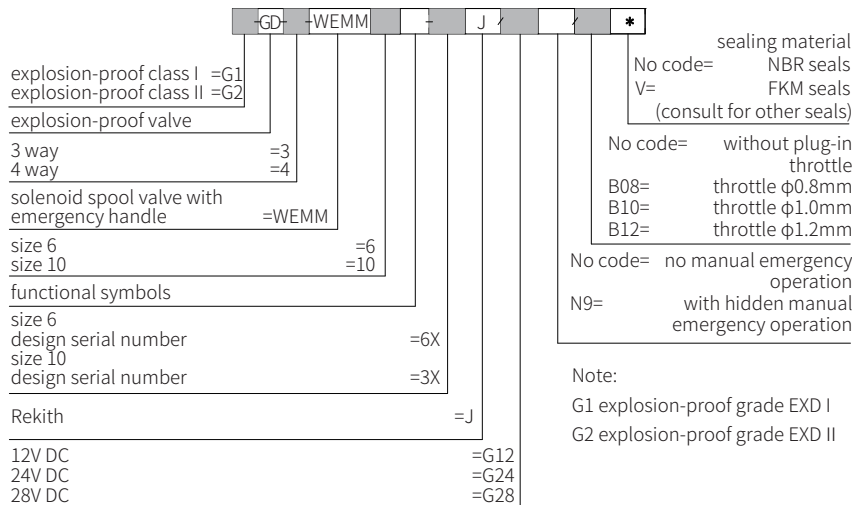

Auxiliary handle operation:

When the solenoid is not energized, the valve spool (3) can be moved by operating the auxiliary handle. Turn the auxiliary handle (5) to the right so that the operating force acts on the valve spool (3) through the spindle (6), the ball valve core (7) and the guide sleeve (8) to move it to the left. When the auxiliary handle (5) returns to the zero position, the valve spool (3) returns to the original position under the action of the reset spring (9).

Features

- Steel ball directional valve operated by explosion-proof solenoid
- Switching smoothly even in high-pressure state long periods
- Closed port without leakage

Any part of this brochure can not be reproduced, edited, copied and disseminated electronically in any way without authorization of Jiayite Hydraulics company. As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

2/2-way, 3/-way poppet directional valve

The G-M-SEW directional valve is explosion-proof solenoid operated poppet valve. It is used to control the opening, closing and direction of oil.

The valve is mainly composed of valve body (1), solenoid (2), hardened valve system (3) and ball (4) as the closing element. Basic function:

In the initial position, the spool (4) is pushed against the valve seat by the spring (9) and by the solenoid (2) when in the switching position. The force of the solenoid (2) acts on the actuating push rod which is sealed on both sides through the lever (6) and the ball (7). The chamber between the two sealing elements is connected to the port P. Therefore, the valve system (3) is pressure compensated based on the actuating force (solenoid or spring). In this way, the valve can be used up to 630bar.

Note:

The 3/2-way poppet directional valve has negative cover function. Therefore, port T must be always connected. That means the ports P-A-T are connected with each other during the switching process (from the starting of the opening of one valve seat to the closing of the other valve seat). But this process is completed in a very short time, so it is irrelevant in almost all applications. It must ensure that the maximum flow does not exceed the performance limit of the valve. If necessary, the cartridge throttle can be installed to limit the flow.

Function description, sectional drawing

4/2-way solenoid directional seat valve G-M-4SEW6

Initial position: When the solenoid is not energized, the force of the spring (6) holds the ball spool (12) on the left valve seat (8). The port P is connected to A. The pump pressure oil acts on the large area of the control piston (15) through the control line from port A. The steel ball (13) is pushed to the other side of the valve seat (14), so P is connected to A and B to T.

Switching position: After the solenoid is powered on, the oil port A and T are connected. In addition, the control line from the oil port A acts on the large area of the control piston (15) to unload to the tank. The pressure oil provided from the oil port P pushes the steel ball (13) to the valve seat (14). At this time, the oil port P is connected to B.

Model G-M-4SEW6Y...3XJ/

The seat valve with plus-1 plate as below:

Cartridge throttle

Due to the working conditions limitations, it may occur that the flow exceeds the performance limit of the valve during the switching process, then the use of a throttle is required.

- Example:
- Accumulator operation
- Used as a pilot valve with internal pilot oil supply

3/2-way poppet valve

The throttle is inserted into the port P of the directional valve.

4/2-way poppet valve

The throttle is inserted into the oil port P of the plus-1 plate.

Cartridge check valve

The cartridge check valve allows free flow from P to A and leak-free closure from A to P.

3/2-way poppet valve

The cartridge check valve is inserted into the oil port P of the directional valve.

4/2-way poppet valve

The cartridge check valve is inserted into port P of the plus-1 plate.

Note:

- In order to operate the valve safely or keep it in the switching position, the oil port pressure $P \geq A \geq T$ (based on the structure).
 - The ports P, A and T (3/2-way valve), and ports P, A, B and T (4/2-way valve) are configured according to their functions and must not be blocked or used in other ways. Liquid flow is only allowed in the direction of the arrow.
 - When using the plus-1 plate (4/2-way valve), the following data must be met: $P_{min}=8\text{bar}$; $Q>3\text{ L/min}$
 - The specified maximum flow should not be exceeded.
- The characteristic limit is measured when the solenoid is at operating temperature, at 10% below the standard voltage and without tank preloading.

Function description, sectional drawing

3/2-way directional seat valve

General:

The G-M-SEW directional valve is explosion-proof solenoid operated poppet valve. It is used to control the opening, closing and direction of liquid flow.

The valve mainly includes valve body (1), solenoid (2), hardened valve system (3) and ball (4) as the closing element.

Basic function:

In the initial position, the spool (4) is pushed to the seat by the spring (9) and by the solenoid (2) when in the switching position. The force of the solenoid (2) acts on the actuating push rod (8) which is sealed on both sides through the lever (6) and the ball (7). The chamber between the two sealing elements is connected to the port P. Therefore, the valve system (3) is pressure compensated based on the actuating force (solenoid or spring). In this way, the valve can be used up to 630bar.

Note:

The 3/2-way poppet directional valve has negative cover function. Therefore, the port T must be always connected. That means the ports P-A-T are connected with each other during the switching process (from the starting of the opening of one valve seat to the closing of other valve seat). But this process is completed in a very short time, so it is irrelevant in almost all applications.

It must ensure that the maximum flow does not exceed the performance limit of the valve. If necessary, the cartridge throttle can be installed to limit flow.

Function description, sectional drawing

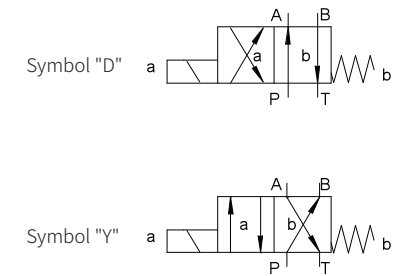

4/2-way poppet directional valve

Initial position: When the solenoid is not energized, the force of the spring (6) holds the ball spool (12) on the left valve seat (8). The port P is connected with A. The pump pressure oil acts on the large area of the control piston (15) through the control line from port A. The steel ball (13) is pushed to the other side of the valve seat (14), so the oil port P is connected to A and B to T.

Switching position: After the solenoid is powered on, the oil port A acts on the large area of the control piston (15) to unload to the tank. In addition, the control line from the oil port P pushes the steel ball (13) to the valve seat (14). At this time, the oil port P is connected to B.

The seat valve with plus-1 plate as below:

Cartridge throttle

Due to the working conditions limitations, it may occur that the flow exceeds the performance limit of the valve during the switching process, then the use of a throttle is required.

Example:

- Accumulator operation
- Used as a pilot valve with internal pilot oil supply

3/2-way poppet valve

The throttle is inserted into the port P of the directional valve.

4/2-way poppet valve

The throttle is inserted into the oil port P of the plus-1 plate.

Cartridge check valve

The cartridge check valve allows free flow from P to A and leak-free closure from A to P.

3/2-way poppet valve

The cartridge check valve is inserted into the oil port P of the directional valve.

4/2-way poppet valve

The cartridge check valve is inserted into port P of the plus-1 plate.

V1 and V2 in the switching position: both ends of the cylinder are connected to the tank port. Attention! When using single rod cylinders, the performance limit (double flow) of the valve and the maximum allowable working pressure (overpressure) must be taken into account!</p>		

Explosion-proof Electro-hydraulic Directional Valve

Model: G-WEH...4X/6X/7XJ

- ◆ Size 10~32
- ◆ Maximum working pressure 350 bar
- ◆ Maximum working flow 1100 L/min

Contents

Function description, sectional drawing	02-03
Models and specifications	04
Functional symbols	05-07
Technical Parameters	08-09
Characteristic curve	10-14
Characteristic limit	10-14
Switching time adjustment, pressure reducing valve and pre-load valve	15
Component size	16-24

Features

- Mainly used to control the opening closing and flow direction of liquid flow
- Subplate mounting
The mounting surface according to DIN24340 form A and ISO4401
- Spring or hydraulic centered
Spring or hydraulic return to initial position
- Explosion-proof solenoid
- Optional switching time adjustment
- Optional pre-load valve in port P of the main valve

Function description, sectional drawing

The G-WEH directional valve is a directional spool valve with explosion-proof electro-hydraulic operation. It is used to control the opening, closing and direction of the liquid flow.

The valve mainly consists of valve body (1), control spool (2), main valve with one or two reset springs (3.1) and (3.2), pilot valve (4) with one or two explosion-proof solenoids "a" (5.1) and "b" (5.2).

The main control spool is held in the neutral or initial position by springs or pressure. For the valve with spring-centered, the two spring chambers (6) and (8) are connected to the oil tank through the pilot valve in the initial position. The pilot valve (4) is supplied with oil through the control line (7). The control oil can be supplied internally or externally (externally via port X).

The main control spool (2) is hydraulically operated by the pilot valve (4). Due to the operating of the pilot valve on one end of the main control spool, the spool moves to the operation position, then the valve opens in the operation direction and the fluid flows from P to A and B to T or P to B and A to T. The control oil can be drained internally or externally.

4/3-way directional valve with hydraulic centered of main valve, model WEH..H/

In this structure, pressure oil acts on both end surfaces of the main control spool (2). The centering sleeve (10) locates the main control spool (2) and keeps it in the middle position.

If one end of the main spool (2) is unloaded, the main spool (2) moves to the working position under the pressure from the other end, thereby changing the direction of the oil flow. The unloaded control spool face displaces the returning pilot oil into port Y externally through the pilot valve (4). The oil is drained internal from port L to the tank directly.

Structural diagram of electro-hydraulic directional valve with hydraulic centered

Function description, sectional drawing

Pilot oil supply

1. Model G-WEH10

(1) Conversion between internal supply and external supply:

The channel P on the top of the main valve body with M6 screw (3) is external supply, and is internal supply when M6 screw (3) dismounted.

(2) Conversion between internal drain and external drain:

Removing the plug (1) and installing M6 screw (2) is external drain, dismounting the M6 screw (2) is internal drain.

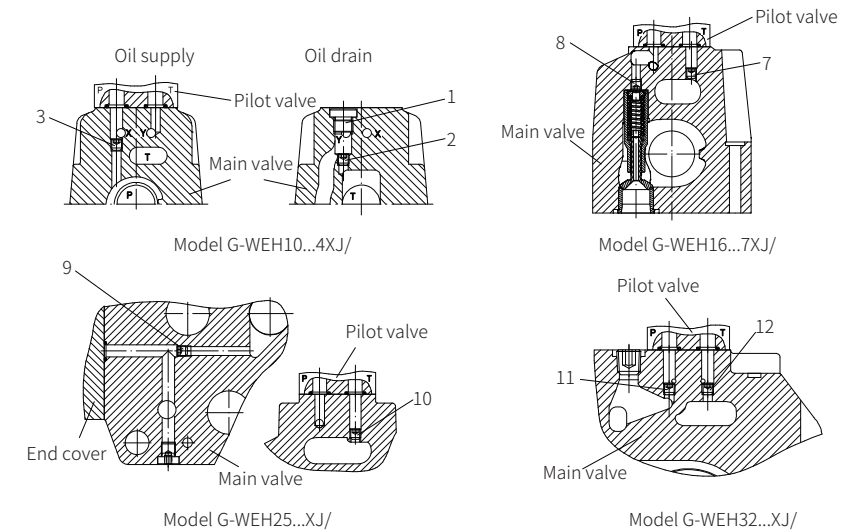

2. Model G-WEH16

(1) Conversion between internal supply and external supply:

The channel P on the bottom of the main valve with M6 screw (8) is external supply, and is internal supply when M6 screw (8) dismounted.

(2) Conversion between internal drain and external drain:

The channel T on the top of the main valve with M6 screw (7) is external drain, and is internal drain when M6 screw (7) dismounted.

3. Model G-WEH25

(1) Conversion between internal supply and external supply:

The channel P on the top of the main valve with M6 screw (9) is external supply, and is internal supply when M6 screw (9) dismounted.

(2) Conversion between internal drain and external drain:

The channel T on the top of the main valve with M6 screw (10) is external drain, and is internal drain when M6 screw (10) dismounted.

4. Model G-WEH32

(1) Conversion between internal supply and external supply:

The channel P on the top of the main valve with M6 screw (11) is external supply, and is internal supply when M6 screw (11) dismounted.

(2) Conversion between internal drain and external drain:

The channel T on the top of the main valve with M6 screw (12) is external drain and is internal drain when M6 screw (12) dismounted.

H	160	150	120
G, T	160	160	140
F, P	160	140	120

Notice:

The given characteristic limits are suitable for the use of flow in both directions (e. g. from P to A and return from B to T at the same time).

Due to the power of the fluid in the valve, the characteristic limit allowed for only one flow direction might be significantly reduced (e.g. from P to A, while B is closed)!

The characteristic limits are measured when the solenoid is at the operating temperature, at 10% below the standard voltage and without tank preloading.

Characteristic curve

Model G-4WEH16...(Measured at $\vartheta_{oil}=41mm^2/s$ and $t=50^\circ C$)

Main valve hydraulic return					
HC, HD, HK	300	300	300	300	300
HZ, HY	300	300	300	300	300

- 1) The given flow value can be achieved when the minimum pilot pressure of 1.2MPa exists.
- 2) The given flow value is limiting the value at which the reset spring can return the valve when the pilot pressure decreases.

Allowable flow of 3-position valve (L/min)						
Spool	Working pressure(MPa)					with pre-load valve and X-port internal supply
	7	14	21	28	35	
Main valve spring return ¹⁾						
E, H, J, L, MQ, U, W, R	300	300	300	300	300	Spools F, G, H P and S in general
F, P	300	250	180	170	150	
G, T	300	300	240	210	190	
S	300	300	300	250	220	
V	300	250	210	200	180	
Pressure centered (minimum pilot pressure 1.6MPa)						
All spools	300	300	300	300	300	Spool approx. to 160L/min

Notice:

When using a 4/3-way valve with pressure centered in the main spool which exceeds the given performance limits, a higher pilot pressure is required. Therefore, if the pressure is 35MPa and the flow is 300L/min in the circuit, the pilot pressure of 1.6MPa is required.

The maximum flow of the valve only depends on the acceptable pressure drop through the valve.

When internal supply, a back pressure valve is required because of negative cover of spools Z, HZ, V and the flow less than 180L/min. It is also required due to negative cover of spools F, G, M, P and T.

1)The specified flow value is the limited value at which the reset spring can return the spool back to the end position when the pilot pressure disappears.

Notice:
When using a 4/3-way valve with pressure centered in the main spool which exceeds the given performance limits, a higher pilot pressure is required. Therefore, if the pressure is 35MPa and the flow is 300L/min in the circuit, the pilot pressure of 1.5MPa is required. The maximum flow of the valve only depends on the acceptable pressure drop through the valve.

- 1) The given flow value can be achieved when the minimum pilot pressure of 1.0MPa exists.
- 2) The given flow value is limiting the value at which the reset spring can return the valve when the pilot pressure decreases.

Operating time, pressure valves and pilot valves

Switching time adjustment

To control the switching time of the main valve (1), a double throttle check valve (12) is installed between the pilot valve and the main valve. Conversion from meter-in control (13) to meter-out control (14): Remove the pilot valve (4) but retain the O-ring support plate (15), turn the throttle check valve around its longitudinal axis and reassemble it on the mounting surface, install the pilot valve (4). Tightening torque $M_A=9\text{Nm}$ for fixing screw (16).

Model G-4WEH.../.../S or S2

Pressure reducing valve "D3"

The pressure reducing valve (17) must be used if the pilot pressure exceeds 25MPa. The secondary pressure should be maintained at 4.5MPa. When using the pressure reducing valve D3, it must install a plug-in throttle B10 in port P of the pilot valve. Tightening torque $M_A=9\text{Nm}$ for fixing screw (16).

Model G-4WEH.../.../D3

Pre-load valve (not for size 10)

In the valve with pressureless bypass and internal pilot oil supply, a pre-load valve (18) is installed in port P of the main valve to build up the minimum pilot pressure. The differential pressure of the pre-load valve must be added to the differential pressure of the main valve to determine the actual value (see characteristic curve). The cracking pressure of the valve is 0.45Mpa.

Features

- Remote control
- Subplate mounting
- 3 pressure adjustment elements

Any part of this brochure can not be reproduced, edited, copied and disseminated electronically in any way without authorization of Jiayite Hydraulics company. As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The DBT/DBWT remote pressure valve is direct relief valve. This valve has the advantages of simple structure, convenient pressure control, good stability and no noise. It is suitable for plastic machine, machine tool, metallurgy, mining, engineering and other fields in automatic control of hydraulic system.

Model DBT:

This valve is used to remote control the pressure of the system.

It is composed of valve body (1), valve spool (2), valve seat (3), spring (4) and adjustment element (6).

The pressure of the system acts on the valve spool (2) by orifice. When the pressure exceeds the setting value at the spring (4), the oil drain to tank from port T (or drain external).

Model DBWT:

This valve is used to remote control the pressure of the system and drain by means of the solenoid valve.

It is composed of valve body (1), valve spool (2), valve seat (3), spring (4), pilot valve (5) and adjustment element (6). The working principle is same as DBT but to drain the pressure via pilot valve (5).

Features

- Inserted cartridge
- Threaded connection
- Subplate mounting
- 3 pressure adjustment elements
 - Inner hexagon adjusting screw with protective cap
 - Adjusting handle
 - Adjusting handle with lock

Function description, sectional drawing

The DBD pressure relief valve is direct operated, it is used to limit the pressure of hydraulic system.

The valve is composed of valve sleeve (1), spring (2), poppet spool (3) with damping (pressure grade 25 to 400 bar) or ball spool (4) (pressure grade 630bar) and pressure adjustment element (5). The system pressure can be set infinitely by the adjustment element (5). The spring (2) pushes the poppet spool (3) onto the valve seat. The channel P is connected to the system and system pressure affect on the area of poppet (or ball) spool.

If the pressure in channel P rises in excess of the value set at the spring (2), the poppet spool (3) or ball spool (4) will opens against the spring (2). The oil flows from channel P to channel T. The stroke of the poppet spool (3) is limited by a pin(6).

In order to gain the accurate setting value within the whole pressure range, the pressure scope is divided into 7 pressure ratings, and every pressure rating has a corresponding spring which may be set maximum pressure.

Model DBDS...K..1XJ/...
Pressure grade 25 bar to 400 bar

Model DBDH...K..1XJ/...
Pressure grade 630 bar (poppet valve, only for size 10)

Overview						
Size		6 and 8	10	15 and 20	25 and 30	
Installation position		Optional				
Environment temperature range	°C	-30 to +80 (NBR seal) -20 to +80 (FKM seal)				
Minimum strength of valve body material		The selection of valve body material has been included in the safety factor in all condition (e.g. referenced pressure strength, thread strength and tightening torques.)				
Hydraulic						
Maximum working pressure	-inlet port	bar	400	630	400	315
	-outlet port	bar	315	315	315	315
Maximum flow rate (standard valve)		See characteristic curve				
Oil fluid		Mineral oil (HL, HLP) ¹⁾ in accordance with DIN 51524; Fast living organisms degraded oil according to VDMA 24568; HETG (Rapeseed oil) ¹⁾ HEPG (Polyethylene glycol) ²⁾ HEES (synthetic ester) ²⁾				
Oil temperature range	°C	-30 to +80 (NBR seal) -20 to +80 (FRM seal)				
Viscosity range	mm ² /s	10 to 800				
Cleanliness of oil		The maximum allowable pollution level of oil is ISO4406 Class 20/18/15 ³⁾				

¹⁾ For NBR seal and FKM seal

²⁾ Only for FKM seal

³⁾ The oil must meet the cleanliness degree requested by the components in the hydraulic system. Effect oil filtration can prevent failure and increase the service life of the components.

Characteristic curve

(Measured when using HLP46, $t_{oil} = 40^\circ\text{C} \pm 5^\circ\text{C}$)

Note:

- This characteristic curve is valid for outlet pressure = 0 over the entire flow range, but no related to the pressure drop in the housing when measuring.
- The characteristic curve is valid only under the environment and temperature conditions. It is necessary to consider that the characteristic curve is affected by changes in boundary conditions.

- This characteristic curve is associated with the given pressure grade (e.g. 200bar). The more the setting pressure value differs from the nominal pressure rating (e.g. <200bar), the pressure increases with the relief flow increases.

Features

- 4 pressure ranges
- 5 circuit options
- With one or two cartridge relief valves
- 4 adjustment elements
 - Rotary knob
 - Hexagon screw with sleeve and protective cap
 - Lockable rotary knob with scale
 - Rotary knob with scale

Function description, sectional drawing

The ZDB and Z2DB type relief valve is pilot operated relief valve with sandwich plate design. It's used to limit the pressure within hydraulic system.

The valve is mainly composed of valve body (7), and together with one or two cartridge relief valves.

The system pressure is set by adjustment element (4).

At rest, the valve is closed. Pressure in port A acts on the spool (1), at the same time the pressure passes through orifice (2) to act on the spring loaded side of spool (1), and through orifice (3) to act on pilot valve spool (6). If pressure of port A rises above the value set on spring (5), then the pilot valve spool (6) opens.

Hydraulic oil flow from the spring loaded side of the spool (1), orifice (3) and channel (8) into port T. The resulting pressure drop moves the spool (1) thereby opening the connection A to T, while maintaining the pressure set at spring (5). Pilot oil return from two spring chambers via port T externally.

Function description, sectional drawing

Relief valve model ZDB and Z2DB are pilot operated relief valve and of sandwich plate design. It's used to limit the pressure within hydraulic system. The valve is composed of valve body (7), with one or two cartridge relief valves, The system pressure is set by adjustment element (4). At rest, the valve is closed. Pressure in port A acts on valve spool (1), at the same time pressure pass through orifice (2) acts on spring, and pass through orifice (3) acts on pilot valve spool (6), if pressure of port A rises above the value set on spring (5), then the pilot valve spool (6) opens. Hydraulic oil flow spring loaded side of the valve spool (1) and orifice (3) into port T. The pressure drop moves valve spool (1) thereby opening the connection A to T, while maintaining the pressure set at spring (5). Pilot oil return from two spring chambers via port T externally.

Function description, sectional drawing

The DC pressure control valve is a balanced valve which is composed of valve body (1), direct operated relief valve (2) and check valve (3).

It is used to maintain the hydraulic load. When the cylinder rises, the pressure oil can pass freely. When it falls, the pressure is resulted in the return pipe to prevent the cylinder from falling due to its own weight.

Features

- Cartridge connection
- 4 pressure range
- 4 adjustment form
 - Rotary knob
 - Internal hexagon adjusting screw with protective cap
 - Lockable rotary knob with scale
 - Rotary knob with scale

Function description, sectional drawing

The DB...K...valve is cartridge pilot pressure relief valve. It's used to limit the pressure in hydraulic system, the system pressure is set by adjustment element (4).

At rest, the valves is closed. The pressure in the port A acts on valve spool (1). At the same time, the pressure is passed through orifice (2) of the spool (1) onto the spring chamber. and through orifice (3) to act on the pilot poppet (6).

If the pressure in port A rises above the setting value of the spring (5), then the pilot poppet (6) opens, The pressure fluid can flow to the spring chamber of valve spool (1), and to port T(Y) through orifice (3) and channel (8), the resulting pressure drop moves valve spool (1) to open the connection from port A to port B. The control oil from 2 spring chambers is drain to the tank through port T (Y).

Any part of this brochure can not be reproduced, edited, copied and disseminated electronically in any way without authorization of Jiayite Hydraulics company. As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The DB2U...-5X/ valve is pilot controlled two-stage concentric type multistage relief valve (two-stage). The main valve and pilot valve are both seat valve. The valve is used to control the system pressure, and it may switch the system pressure to the secondary pressure by the solenoid directional valve.

DB2U valve mainly consists of main valve, 4/3-way(H type) or 4/2-way(D type) solenoid directional valve (size 6), and two pilot valves, the pilot valve (11) is a direct operated relief valve.

Model DB2U...H...-5XJ

When the solenoid is de-energized, the fluid at port A of main valve acts on bottom of main spool (1), and via orifice (2), channel (5), orifice (3), channel (12), port P and T of pilot solenoid valve (18), spring chamber (15) of pilot valve (11), channel (14), spring chamber (9) of pilot valve (7), channel (10) back to tank (pilot oil drain internal), or via external outlet back to tank (pilot oil drain external). Thus, a differential pressure is formed on the main spool when the pressure oil flow through the orifices (2 and 3) and it opens the main spool to make the relief valve unloading.

When solenoid "b" is energized, the fluid of pilot solenoid valve (18) flows from P to A and B to T, at this time the pressure oil of the secondary pilot valve (11) via channel (13), port B and T of pilot solenoid valve, spring chamber (15), channel (14), spring chamber (9) and channel (10) back to tank, then the secondary pilot valve is unloading. The pressure oil of the pilot valve (7) acts on the valve spool (6) through orifice (3). When the system pressure exceeds the setting pressure of the spring (8), the valve spool (6) is opened, and the pressure oil at the upper end of the main spool flows back to the oil tank through channels (4 and 10) and spring chamber (9). In this way, a differential pressure is formed on the main spool and opens the main spool (1). The pressure oil flows from A to B at a set pressure as the primary pressure regulation.

When solenoid "a" is energized, it is a secondary pressure regulation under the same principle (note: the setting pressure of the secondary pilot valve should be less than the setting pressure of the primary pilot valve).

Model DB2U...D...-5XJ

It is the primary pressure regulation when solenoid is de-energized, but the secondary pressure regulation when solenoid is energized. This valve doesn't have solenoid unloading function. The switch of different supply and drain modes can be achieved by assembling the conical plugs (19 and 20).

- Pressure adjusting forms:
 - Rotary knob
 - Internal hexagon screw with protective cap
 - Lockable rotary knob with scale

Function description, sectional drawing

The DB3U valve is a pilot controlled two-stage concentric type multistage relief valve (two or three stages). The main valve and pilot valve are both poppet valve structures. The valve is used to control the system pressure, and it may switch the system pressure to the tertiary or multistage pressure by the solenoid directional valve.

When solenoid is de-energized, the pressure oil at port A is controlled by the pilot valve (7), it acts on bottom of main spool (1), and acts on the upper end of main spool and poppet valve (6) of pilot valve (7) via orifices (2 and 3) and channels (4 and 5).

When the system pressure exceeds the setting pressure of the spring (8), the poppet valve (6) is opened, at the same time, the pressure oil at the upper end of the main spool flows back to the oil tank through the orifice (3), channel (5), spring chamber (9), and channel (10) (control oil drain internal type) or back to the oil tank through the external drain port (control oil drain external).

In this way, a differential pressure is formed on the main spool when the pressure oil flows through orifices (2 and 3) and it opens the main spool. The pressure oil flows from A to B at a set pressure.

When solenoid "a" is energized, the pressure at port A is controlled by pilot valve II.

When solenoid "b" is energized, the pressure at port A is controlled by pilot valve I.

The setting pressure of pilot valve 7 must be higher than the setting pressure of pilot valves I and II.

There are four different models of control oil: supply and drain internal, supply internal and drain external, supply external and drain internal, supply and drain external. (See the symbols of control oil in details).

Function description, sectional drawing

The DB and DBW pressure control valves are pilot operated relief valves. They are used to limit (DB), or to limit and unload by solenoids (DBW) of working pressure.

Pilot relief valve Model DB

This valve is basically composed of main valve (1) with main spool inserted (3) and pilot valve (2) with pressure adjustment element.

The pressure of port P acts on the main spool (3), meanwhile, the pressure is applied via control lines (6) and (7) with orifices (4) and (5) to the spring loaded side of the main spool (3) and on the ball (8) in the pilot valve (2). When the pressure in port P rises excess the spring setting pressure, the ball (8) overcomes the spring pressure (9) to open the pilot valve.

The signal is obtained internally via the control channels (10) and (6) from port P. The oil fluid on the spring loaded side of the main spool (3) flows into spring chamber (12) via control line (7), throttle (11) and ball (8). Thus, it flows internally via control line (13) into the tank for model DB, or flows externally via control line (14) into the tank for model DB..Y. Because of throttle (4) and (5), the pressure drop occurs at the main spool (3) and the connection from port P to port T is opened. The fluid flows from port P to port T while the setting working pressure is no changing. The pressure relief valve can unload or shift the different pressure (second pressure stage) by "X" port.

Model DB10-1-5XJ/

Function description, sectional drawing

Solenoid pilot relief valve Model DBW

In principle, the function of this valve is same with model DB.

But the unloading of the main spool (3) is achieved by operating the built-on directional valve (16).

Model DBW10-1-5XJ/

Solenoid pilot relief valve with switching shock damping(sandwich), model DBW...S...R12

The connection from B2 to B1 opens with delay when switching shock damping valve (17) used, it can prevent pressure peaks and unloading shocks in the return line. The valve is installed between pilot valve and directional control valve (16). The degree of damping (unloading shock) depends on the size of throttle (18). Throttle $\varnothing 1.2\text{mm}$ is used as standard size (ordering code...R12...).

Illustration: directional valve opened

- The unloading function (directional valve function of DBW) cannot be used as safety function!
- When power off or cable breakage, Model DBW... B.. 5XJ/... should use the minimum setting pressure (circulation pressure).
- When power off or cable breakage, the pressure relief function of model DBW...A...5XJ/...is launched.
- The back pressure of pilot oil internal drain in port T or external drain in port Y is 1:1 added in pilot control pressure.

Function description, sectional drawing

The DR10K valve is pilot operated pressure reducing valve installed into the manifolds. It is used to reduce the system pressure. The secondary pressure is adjusted by means of adjusting elements (4). At rest, the valve is normally open. The hydraulic oil can flow freely from port B to port A. The pressure at port A simultaneously acts on the main spool (1) and on the spring-loaded inner side of main spool (1) through the orifice (2). In addition, it acts on pilot poppet (8) through the orifice (7). If the pressure at port A exceeds the setting value of the spring (5), the pilot poppet (8) opens. The hydraulic oil flows from spring chamber (3) to working port Y through orifice (7), pilot poppet (8) and spring chamber (6). The main spool (1) moves to the control position and keeps the pressure value set on spring (5) constant in port A. The pilot oil is always drained externally from the spring chamber (6) through port Y. Note: The value in port Y must be increased to the setting pressure value.

Function description, sectional drawing

The ZDR6DP0...4XJ/40YM type reducing valve is modular direct-operated pressure reducing valve, it is used to reduce the system pressure. The valve is composed of valve body (1), valve spool (2), spring seat (3) and pressure spring (4).

At rest, the valve is normally open and the oil can freely flow from port P1 to port P2. The pressure in port P2 acts on the piston area opposite to the pressure spring. If the pressure in port P2 continues to increase due to external force, the valve spool is moved still towards the pressure spring (4), then the oil at port P2 is connected to the oil tank through the shoulder on the control piston (2).

The sufficient oil flows back to the tank to prevent further pressure increase. The oil in the spring chamber is drained to the oil tank through the port T.

Function description, sectional drawing

The ZDR6D... reducing valve is a three-way direct operated pressure reducing valve with sandwich plate construction and reducing in the secondary circuit. It is used for system pressure reducing.

The valve is composed of valve body (1), control spool (2), compression spring (3), adjusting element (4) and an optional check valve. The secondary pressure is set by the adjusting element (4).

Model DA

At rest, the valve is normally open, the fluid is flow freely from port A1 to port A2. The pressure in port A2 acts on the piston area opposite to the compression through the control channel (5). When the pressure at port A2 exceeds the set value of spring (3), the control spool (2) is moved to the control position, the pressure at port A2 remains stable. The signal and control oil are supplied internal from port A2 through the control channel (5).

If the pressure at port A2 continues to increase due to external force acts on the actuator, the valve spool will still move towards the compression spring (3), then the port A2 is connected to the oil tank through the shoulder (9) on the control piston (2). The sufficient oil flows back to the tank to prevent further pressure increase. The oil in the spring chamber (7) is drained external to the oil tank through the orifice (6) to the port T.

The pressure gauge connection (8) is used for secondary pressure monitoring of the valve. In the version DA, the check valve can only be added to the oil port from A2 to A1 to ensure flow passage smoothly.

Model DP and DB

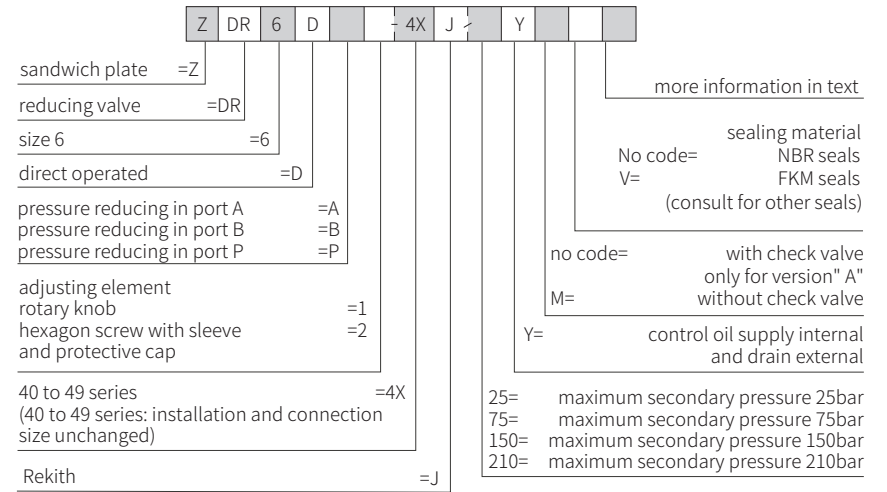

In model DP, the pressure is reduced in port P1, the signal and control oil are supplied internal from port P1.

In model DB, the pressure is reduced in port P1, but control oil is taken from port B. When the directional valve in position P to A, the pressure of port B must not exceed the set pressure. Otherwise, the pressure at port A will be decrease.

- Check valve, optional
- 4 pressure ratings

Function description, sectional drawing

The ZDR10D...5XJ/... reducing valve is direct operated pressure reducing valve with sandwich plate construction, it is used for system pressure reducing.

The valve is composed of valve body(1), control spool (2), compression spring (3), adjusting element (4) and an optional check valve.

Model ZDR10DA

At rest, the valve is normally open, the fluid flows freely from port A1 to A2. The pressure in port A2 acts on the spool face(2) opposite the compression spring (3) through the control channel (5). When the pressure at port A2 exceeds the set value of spring (3), the control spool (2) is moved to the control position, the pressure at port A2 remains stable. The working pressure and control oil are supplied internal from port A2 through the channel channel (5). If the pressure at port A2 continues to increase due to external force acts on the actuator, the control spool (2) will still move towards the compression spring (3), then the port A2 is

connected to the oil tank through the shoulder (9) on the control spool (2) and valve body (1). The sufficient oil flows back to the tank to prevent further pressure increase. The oil in the spring chamber (7) is drained external to the oil tank through the port TA.

The pressure gauge connection (8) is used for secondary pressure monitoring of the valve. Only in version "A", a check valve can be used for free flow back from port A2 to A1.

Model ZDR10DP and ZDR10DB

In model DP, the pressure is reduced in port P1, the signal and control oil are provided internally from port P1.

In model DB, the pressure is reduced in port P1, but the control oil is taken from port B.

Attention:

In model DB, when the directional valve in position P to A, the pressure of port B must not exceed the set pressure. Otherwise, the pressure at port A will be decrease. The check valve is only installed in version DA and allow oil flows freely from A2 to A1.

Function description, sectional drawing

The DR5DP valve is a 3-way direct operated pressure reducing valve and used to reduce the pressure of circuit.

It is composed of valve body (1), control spool (2), compression spring (3), adjusting element (4), and an optional check valve(5). The secondary pressure is set via the adjusting element (4).

At rest, the valve is normally open, the fluid can flow freely from port P to port A. The pressure at port A acts on the spool face of compression spring(3) via control line (6) and orifice(7). When the pressure at port A exceeds the setting value of the compression spring (3), the control spool (2) moves into the control position and the pressure at ports A remains constant. The control oil are supplied internally from port A, and also can be supplied externally via the port X.

If the pressure at port A continues to increase due to external force, the control spool (2) will still move towards the compression spring (3), then the port A is drained to the oil tank via the shoulder (8) to prevent further pressure increase. The control oil in the spring chamber is drained external to the oil tank through the port Y(T).

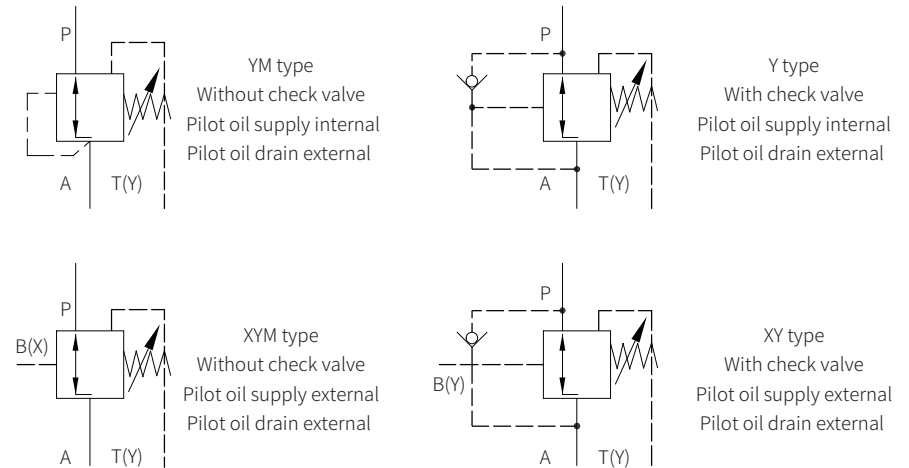

An optional check valve (5) allows the fluid to flow freely from port A to port P.

Technical parameters

Hydraulic oil	Mineral oil(HL, HLP) according to DIN 51 524; Phosphate oil(HFD-R)
Hydraulic oil temperature range °C	-30 to +80 (NBR seal)
	-20 to +80 (FKM seal)
Viscosity range mm ² /s	10 to 800
Cleanliness of oil	The maximum allowable pollution level of oil is ISO4406 Class 20/18/15
Working pressure port P bar	to 315
Secondary pressure port A bar	to 25; to 75; to 150; to 210; to 315 (without check valve)
Backpressure port T(Y) bar	to 60
Maximum flow L/min	to 15
Weight Kg	about 1.2

Characteristic curve

(Measured when using HLP46, $\vartheta_{oil}=40^{\circ}\text{C} \pm 5^{\circ}\text{C}$)

The P_{Amin} -Q curve represents the relationship between the minimum setting pressure and the flow-rate from P to A.

For example: when pressure is 25 bar and flow-rate is 10L/min, the pressure at port A is set 20 bar, when the secondary pressure increase to 23 bar, the flow-rate decreases to near zero.

Function description, sectional drawing

The DR... valve is pilot operated pressure reducing valve, it is composed of the main valve (1) with main spool insert (3) and pilot control valve (2) with pressure adjusting element.

At rest, the valve is normally open. The fluid flows freely from port B to port A via the main spool insert (3). The pressure at port A acts on the lower main spool side. At the same time, the pressure acts on the spring-loaded side of the main spool (3) via the throttle (4) and the ball (6) in the pilot control valve (2) via the channel (5). It also acts on the ball (6) via throttle (7), control line (8), check valve (9) and throttle (10). Depending on the spring (11) setting, a pressure builds up in front of the ball (6), in the channel (5) and in the spring chamber(12) to keep the control spool (13) in opened position. The fluid can flow freely from port to port A via the main spool insert (3) until the pressure at port A exceeds the setting value of the spring (11) and opens the ball (6). The control spool (13) moves in closing direction.

The desired reduced pressure is achieved when there is a state of equilibrium between the pressure at port A and the setting pressure of the spring (11).

The control oil is drained from the chamber of spring (14) externally to the oil tank via the control line (15). An optional check valve (16) allows the oil to flow freely from port A to port B, and the pressure gauge connection (17) is used for the reduced pressure monitoring in port A.

Function description, sectional drawing

The DR...4XJ valve is pilot operated pressure pressure reducing valve, it is used to reduce the system pressure. The valve is composed of the plug-in valve and valve body, and an optional check valve (only for subplate mounting).

At rest, the valve is normally open. The fluid can flow freely from port B to port A via main spool (1). The pressure at port A is applied to the spring-loaded side of the main spool via the orifice (2). At the same time, the pressure acts on the side of the main spool (1) which is opposite to the spring via orifice (3) and (4). from the oil port A via the main spool with holes (2) and throttle holes (3) and (4).

If the pressure at port A exceeds the setting value of the spring (6), the pilot valve (5) opens. Then the fluid flows from spring-loaded side of the main spool (1) via the orifice (7) and poppet valve spool (5) to the spring chamber(8). The main spool (1) moves to the control position and keeps the pressure value set on spring(6) constant in port A.

The pilot control oil is always drained external from spring chamber (8) via the port Y (9). An optional check valve can be installed to allow the oil to flow freely from port A to port B in reverse direction.

Function description, sectional drawing

The 3DR10P valve is 3-way pressure reducing valve with pressure limitation in the secondary circuit to ensure that the secondary pressure is stable. It is used to reduce the pressure in the hydraulic system. The valve is composed of valve body(1), control spool (2) and pilot valve (3) with adjusting element (10). At rest, the valve is normally open, the fluid can flow freely from P to A. The pressure at port A acts to the spool area opposite to the compression spring (9) via control channel(4). Meanwhile, the fluid acts on the ball valve(7) of the pilot valve(3) via throttle (6) and channel (5). Based on the setting value of the spring (11), the pressure builds up in front of the ball (7) and in channel (5) to hold the control spool in the opening position. The oil can flow freely from port P to port A via control spool(2) until the pressure at port A exceeds the setting value of spring (11) and opens the ball valve (7). The control spool (2) moves to the close position. The required reduced pressure is achieved when a balance between the pressure at port A and the pressure setting value of spring (11) is reached. If the pressure at port A continuously increases due to external forces, the control spool(2) is still moved towards to the compression spring (9). Thus port A is connected to port T via the control lands (8) of the control spool (2). Enough oil flows to tank to ensure that the pressure does not rise any further. The pilot oil in the spring chamber (12) returns external via control line(13) to port Y, and then flow at zero pressure to tank. The pressure gauge connection (14) is used for the reduced pressure monitoring in port A.

Function description, sectional drawing

The DZ5DP pressure control valve is a direct operated sequence valve, it is used to set the pressure to supply oil to the secondary system.
 The valve is composed of valve body (1), control spool (2), spring (3), pressure setting element (4) and optional check valve (5) as required, the pressure is setting via the pressure setting element (4).
 The spring (3) holds the control spool (2) in the initial position. The pressure oil in port P acts to the spool area opposite to the spring (3) via the hole (6) and the throttle hole (7). When the pressure in port P reaches the setting value, the spool moves against the spring force so that the port P and the port A are connected. At that time, the oil flows into the system connected to port A, but the pressure in port P does not fall, and the control oil can also supply external via port X.
 Depending on the application of the valve, the pilot oil can return externally via port Y(T) or internally. The check valve (5) is installed as required to allow the fluid flow back freely from port A to port P.

Function description, sectional drawing

The DZ6DP valve is direct operated sequence valve, it is used for sequence switching of the secondary circuit pressure. The sequence pressure is setting via the adjusting element (4).

The spring (3) holds control spool (2) in initial position, the valve is closed. The pressure in port P acts on the piston area of the control spool (2) via the control line (6) at the opposite of the spring (3). When the pressure in port P reaches the setting value of spring (3), the control spool (2) moves to the left to connect port P and port A, the pressure in port P not fall.

The control signal is obtained from port P internally via the control line (6) or externally via port B (X). Depending on the application of the valve, the leakage oil can return externally through port T (Y) or internally through port A.

Notice:

For internal drainage, the set opening pressure increases the pressure in port A. The fluid can flow freely from port A to port P via installing check valve (5). Pressure gauge connection(1) is used to monitor the set sequential pressure.

Function description, sectional drawing

The DZ10DP valve is direct operated sequence valve, it is used for sequence switching of the secondary circuit pressure. The sequence pressure is setting via the adjusting element (1).

The compression spring (2) holds the spool (3) in initial position, the valve is closed. The pressure in port A passes into the spool area via control line (4) to form a force which acts on the spool (3) opposite the compression spring (2). When the pressure reaches the setting value of the spring (2), the spool (3) is moved to connect port A and B. The systems connected with port B is sequenced while the pressure in port A will not drop. The control signal is obtained from port A via control line (4) or internally via port X. Based on the valve application, the leakage oil can return externally via port Y or internally via port B.

Notice!

For internal drainage, the set opening pressure increases the pressure in port B. The fluid oil can flow freely from port B to port A via installing check valve. Pressure gauge connection (6) is used to monitor the set sequential pressure.

As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The ZDZ6D valve is sandwich plate type direct operated sequence valve, it is used for secondary circuit pressure dependent sequential switching.

The sequence pressure is setting via the adjusting element (4). The control spool (2) is hold in the initial position by the compression spring (3), the valve is closed. The pressure in port P1 acts on the spool area of the control spool (2) via the control line (5) opposite the compression spring.

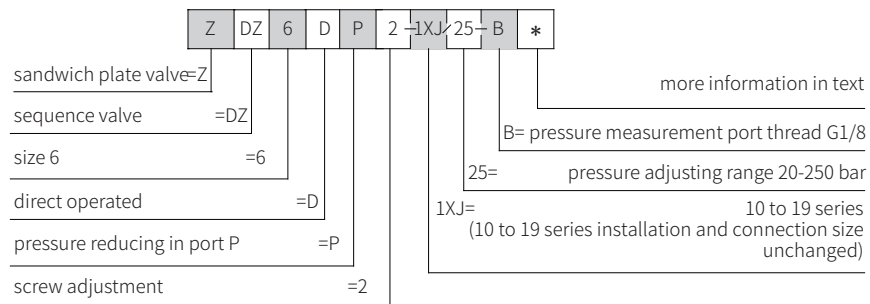

When the pressure in port P1 exceeds the setting value of the spring (3), the control spool (2) moves toward the spring to open the port P. The fluid flows from P1 to P2. The pressure gauge connection (1) is installed to monitor the pressure of the sequence.

 - Lockable rotary knob with scale
 - Rotary knob with scale
- 4 pressure ranges
- Check valve, optional

Function description, sectional drawing

The DZ pressure valve is pilot operated sequence valve, it is used for pressure dependent sequence switching of the secondary circuit. The valve is mainly composed of main valve (1) with main spool insert (7), pilot control valve (2) with pressure adjusting element, and an optional check valve(3).

The valve function varies according to pilot oil supply and drain configuration:

Preload valve model DZ...-5XJ/...(Control lines 4.1, 12 and 13 open; control lines 4.2, 14 and 15 closed)

The pressure in port A acts on the pilot spool (5) of the pilot valve(2) via the control line(4.1), and acts on the spring-loaded side of the main spool(7) via throttle (6) at the same time. When pressure exceeds the setting value of the spring (8), the pilot valve spool (5) is moved against spring (8). The control signal is obtained internally from port A via control line (4.1).

The fluid in spring chamber of main spool(7) via throttle (9), control shoulder (10), control lines (11) and (12) flow into port B. Thus, the pressure differential is formed at the main spool(7), the port A and port B is connected, and the setting value of the spring (8) remains unchanged. The leakage oil of the pilot valve spool (5) flows into port B internally via control line(13). An optional check valve (3) can be installed to allow the fluid flow freely from port B to port A.

Preload valve model DZ...-5XJ/..X...(Control lines 4.2, 12 and 13 open; control lines 4.1, 14 and 15 closed)
In principle, the function of this valve is same as model DZ... -5XJ/... but the signal is provided externally via control line (4.2) for model DZ...5XJ..X...

Function description, sectional drawing

Preload valve model DZ...-5XJ/..Y...(Control lines 4.1, 12, and 14 or 15 open; control lines 4.2 and 13 closed)
In principle, the function of this valve is same as model DZ... -5XJ/...

But for model DZ...5XJ..Y, the leakage at the pilot valve (5) must be drained to tank without pressure via control line (14) or (15), the pilot oil flows into port B via control line (12).

Preload valve model DZ...-5XJ/..XY...(Control lines 4.2, 14 or 15 open; control lines 4.1, 12 and 13 closed)

The pressure in port X acts on control piston (5) of pilot valve (2) via control line (4.2). At same time, the pressure in port A acts on spring chamber of main spool(7) via throttle (6). When the pressure in port X exceeds the setting value of the spring (8), the control piston (5) is moved against the spring (8), the fluid flows from spring chamber of main spool (7) to spring chamber (17) of pilot valve (2) via orifice (9) and hole (16). The pressure in spring chamber of main spool (7) decreases. Thus, the fluid can flow from port A to port B with minimum pressure lose. The control oil in spring chamber (17) should be drained to tank without pressure via control line (14) or (15). An optional check valve (3) can be installed to allow the fluid flow freely from port B to port A.

Component size	07-08
Application example	09

Features

- For subplate mounting
- 3 adjusting elements
 Rotary knob
 Hexagon screw with sleeve and protective cap
 Lockable rotary knob with scale
- 3 pressure ranges
- Solenoid operated unloading by a built-on directional valve

Function description, sectional drawing

The DA/DAW pressure control valve is pilot operated pressure shut-off valve. It is used to switch the pump flow to pressureless bypass when the accumulator loading pressure is reached. The other applications of the valve is in high/low pressure pump system. In this application, the low pressure pump is switched to pressureless bypass when the pressure reaches the high pressure setting value.

The valve is composed of main valve (12) with main spool assembly (6), pilot valve (2) with pressure adjusting element and check valve (1). For size 10 valve, the check valve (1) is installed in the main valve (12). For size 25 and 32, the check valve (1) is built into a separate subplate installed under the main valve (12).

Pressure shut-off valve mode DA

Diverting the pump flow from P to A - P to T.

The pump supply oil for hydraulic system (P to A) via check valve (1). The pressure in port A acts on pilot valve spool (4) via control line (3). At same time, pressure in port P passes to the spring chamber of main spool (6) and conical spool (8) of pilot valve (2) via orifices (5) and (7). The conical spool lifts off its valve seat against the spring (9) when the setting cut-off pressure of hydraulic system is reached. The fluid flows into spring chamber (11) via orifices (5) and (7), or the fluid returns to tank external via control line (13) in model DA...3XJ...Y.

Due to orifices (5) and (7), there is pressure drop in the main spool (6). Then the main valve spool (6) lifts off its seat and opens the connection from P to T. And the check valve (1) closes the connection from A to P.

Now the poppet valve (8) is kept opening by the system pressure via pilot valve spool (4).

Function description, sectional drawing

Diverting the pump flow from P to T - P to A.

The area of the pilot valve spool (6) is 17% greater than the effective area of the conical spool (9), thus the effective force on the pilot valve spool (6) is 17% greater than the effective force on the conical spool (9).

When the actuator pressure drop to equal the cut-off pressure of the valve that corresponds to the switching pressure differential, the spring (11) pushes the poppet valve (9) on to its seat. The pressure is

built up on the spring loaded side of the main spool (3). In conjunction with spring (14), the main spool (3) is closed and the connection from port P to T is isolated. The pump flow passes again via the check valve (4) into the hydraulic system (P to A).

Pressure shut-off valve model DAW

The function of this valve is basically the same as the DA valve but a solenoid valve (15) is installed on the pilot valve. The switch from P to A or P to T can be achieved under the set pressure by the pilot valve.

Application example

Hydraulic system with accumulator:

installation notes:

- The connection resistance between DA valve and accumulator must be as low as possible

The pilot valve of DA is separately connected to the accumulator when the resistance is high.

Hydraulic system with high and low pressure pump: With high pump flow and small switching pressure differential values (10%), "Y" version valves should preferably be used.

Function description, sectional drawing

The DA/DAW pressure control valve is pilot operated pressure shut-off valve. It is used to switch the pump flow to pressureless bypass when the accumulator loading pressure is reached. The other applications of the valve is in high/low pressure pump system. In this application, the low pressure pump is switched to pressureless bypass when the pressure reaches the high pressure setting value.

The valve is composed of main valve (1) with main spool assembly (3), pilot valve (2) with pressure adjusting element and check valve (4). For size 10 valve, the check valve (4.1) is installed in main valve (1). For size 25 and 32, the check valve (4.2) is built into a separate subplate installed under the main valve (1).

Pressure shut-off valve model DA

Diverting the pump flow from P to A - P to T

The pump supply oil for hydraulic system (P to A) via check valve (4.1). The pressure in port A acts on pilot valve spool (6) via control line (5). At same time, pressure in port P passes to the spring chamber of main spool (3) and conical spool (9) of pilot valve (2) via orifices (7) and (8). The conical spool lifts its valve seat against the spring force (10) when the setting cut-off pressure of the hydraulic system is reached. The fluid flows into spring chamber (11) via orifices (7) and (8), or the fluid returns to tank external via control line (12) in model DA...5XJ...Y.

Due to orifices (7) and (8), there is pressure drop in the main spool (3). The main spool (3) lifts off its seat and opens the connection from P to T. And the check valve (4) closes the connection from A to P. Now the poppet valve (9) is kept opening by the system pressure via pilot valve spool (6).

Function description, sectional drawing

Diverting the pump flow from P to T - P to A

The area of the pilot spool (6) is 10% or 17% greater than the effective area of the conical spool (9), thus the effective force on the pilot valve spool (6) is 10% or 17% greater than the effective force on the conical spool (9). When the actuator pressure drop to equal the cut-off pressure of the valve that corresponds to the switching pressure differential, the spring (10) pushes the poppet valve (9) on to its seat. The pressure is built up on the spring loaded side of the main spool (3). In conjunction with spring (14), the main spool (3) is closed and the connection from port P to T is isolated. The pump flow passes again via the check valve (4) into the hydraulic system (P to A).

Pressure shut-off valve model DAW

The function of this valve is basically the same as the DA valve. But a solenoid directional valve (15) can switch the setting shut-off pressure of the pilot valve (2) either from P to A or from P to T.

With (DAC30) or without (DAC)

Application example

Hydraulic system with accumulator:

installation notes:

- The connection resistance between DA valve and accumulator must be as low as possible
- The pilot valve of DA is separately connected to the accumulator when the resistance is high.

Hydraulic system with high and low pressure pump:
With high pump flow and small switching pressure differential values (10%), "Y" version valves should preferably be used.

Explosion-proof Multistage Electro-hydraulic Pilot Relief Valve

Model: G-DB2U...-5XJ

- ◆ Size 10 to 32
- ◆ Maximum working pressure 350 bar
- ◆ Maximum flow rate 600 L/min

Contents

Function description, sectional drawing	02
Models and specifications	03
Functional symbols	04
Technical parameters	05
Characteristic curve	05-06
Component size	07-09

Features

- Subplate mounting
- Threaded connection
- Cartridge connection
- Two-stage pressure setting
- Controlled by solenoid directional valve
- Pressure adjusting forms:
 - Rotary knob
 - Internal hexagon screw with protective cap
 - Lockable rotary knob with scale.

Function description, sectional drawing

The G-DB2U...5X/ valve is pilot controlled two-stage concentric type multistage relief valve (two-stage). The main valve and pilot valve are both seat valve. The valve is used to control the system pressure, and it may switch the system pressure to the secondary pressure by the solenoid directional valve. G-DB2U valve mainly consists of main valve, 4/3-way (H type) or 4/2-way (D type) solenoid directional valve (size 6), and two pilot valves, the pilot valve (11) is a direct operated relief valve.

Model G-DB2U...H...-5XJ:

When the solenoid is de-energized, the fluid at port A of main valve acts on bottom of main spool (1), and via orifice (2), channel (5), orifice (3), channel (12), port P and T of pilot solenoid valve (18), spring chamber (15) of pilot valve (11), channel (14), spring chamber (9) of pilot valve (7), channel (10) back to tank (pilot oil drain internal), or via external outlet back to tank (pilot oil drain external). Thus, a differential pressure is formed on the main spool when the pressure oil flow through the orifices (2 and 3) and it opens the main spool to make the relief valve unloading.

When solenoid "b" is energized, the fluid of pilot solenoid valve (18) flows from P to A and B to T, at this time the pressure oil of the secondary pilot valve (11) via channel (13), port B and T of pilot solenoid valve, spring chamber (15), channel (14), spring chamber (9) and channel (10) back to tank, then the secondary pilot valve is unloading. The pressure oil of the pilot valve (7) acts on the valve spool (6) through orifice (3). When the system pressure exceeds the setting pressure of the spring (8), the valve spool (6) is opened, and the pressure oil at the upper end of the main spool flows back to the oil tank through channels (4 and 10) and spring chamber (9). In this way, a differential pressure is formed on the main spool and opens the main spool (1). The pressure oil flows from A to B at a set pressure as the primary pressure regulation.

When solenoid "a" is energized, it's a secondary pressure regulation under the same principle (note: the setting pressure of the secondary pilot valve should be less than the setting pressure of the primary pilot valve).

Model G-DB2U...D...-5XJ:

It is the primary pressure regulation when solenoid is de-energized, but the secondary pressure regulation when solenoid is energized. This valve doesn't have solenoid unloading function. The switch of different supply and drain modes can be achieved by assembling the conical plugs (19 and 20).

Function description, sectional drawing

The G-DB3U valve is a pilot controlled two-stage concentric type multistage relief valve (two or three stages). The main valve and pilot valve are both poppet valve structures. The valve is used to control the system pressure, and it may switch the system pressure to the tertiary or multistage pressure by the solenoid directional valve.

G-DB3U valve mainly consists of main valve, 43/-way or 4/2-way directional valve (size 6) and three pilot valves. The pilot valve I and II are direct operated relief valve.

When solenoid is de-energized, the pressure oil at port A is controlled by the pilot valve (7), it acts on bottom of main spool (1), and acts on the upper end of main spool and poppet valve (6) of pilot valve (7) via orifices (2 and 3) and channels (4 and 5). When the system pressure exceeds the setting pressure of the spring (8), the poppet valve (6) is opened, at the same time, the pressure oil at the upper end of the main spool flows back to the oil tank through the orifice (3), channel (5), spring chamber (9), and channel (10) (control oil drain internal type) or back to the oil tank through the external drain port (control oil drain external).

In this way, a differential pressure is formed on the main spool when the pressure oil flows through orifices (2 and 3) and it opens the main spool. The pressure oil flows from A to B at a set pressure.

When solenoid "a" is energized, the pressure at port A is controlled by pilot valve II.

When solenoid "b" is energized, the pressure at port A is controlled by pilot valve I.

The setting pressure of pilot valve 7 must be higher than the setting pressure of pilot valves I and II. There are four different models of control oil: supply and drain internal, supply internal and drain external, supply external and drain internal, supply and drain external. (See the symbols of control oil in details).

Features

- Subplate mounting, threaded connection, manifolds installation
- 5 setting pressure ranges
- Pressure adjusting elements: Rotary knob
- Inner hexagon screw with protective cap

Function description, sectional drawing

The G-DBW pressure control valve is pilot operated relief valve, it is used to limit and unload working pressure by solenoids.

The valve is basically composed of main valve (1) with main spool inserted (3) and pilot valve (2) with pressure adjustment element.

The pressure of port P acts on the main spool (3), meanwhile, the pressure is applied via control lines (6) and (7) with orifices (4) and (5) to the spring loaded side of the main spool (3) and on the ball (8) in the pilot valve (2). When the pressure in port P rises excess the spring setting pressure, the ball (8) overcomes the spring pressure (9) to open the pilot valve.

The signal is obtained internally via the control channels (10) and (6) from port P. The oil fluid on the spring loaded side of the main spool (3) flows into spring chamber (12) via control line (7), throttle (11) and ball (8). Thus, hydraulic oil external drain via control line (14) into the tank for model DBW...Y. Because of throttles (4) and (5), the pressure drop occurs at the main spool (3) and the connection from port P to port T is opened. The fluid flows from port P to port T while the setting working pressure is no changing. The pressure relief valve can unload or shift the different pressure (second pressure stage) by "X" port.

Model G-DBW10-1-5XJ/

Function description, sectional drawing

Solenoid pilot relief valve with switching shock damping(sandwich), model G-DBW.../..S...R12

The connection from B2 to B1 opens with delay when switching shock damping valve (17) used, it can prevent pressure peaks and unloading shocks in the return line. The valve is installed between pilot valve and directional control valve (16). The degree of damping (unloading shock) depends on the size of throttle (18). Throttle $\varnothing 1.2\text{mm}$ is used as standard size (ordering code...R12...).

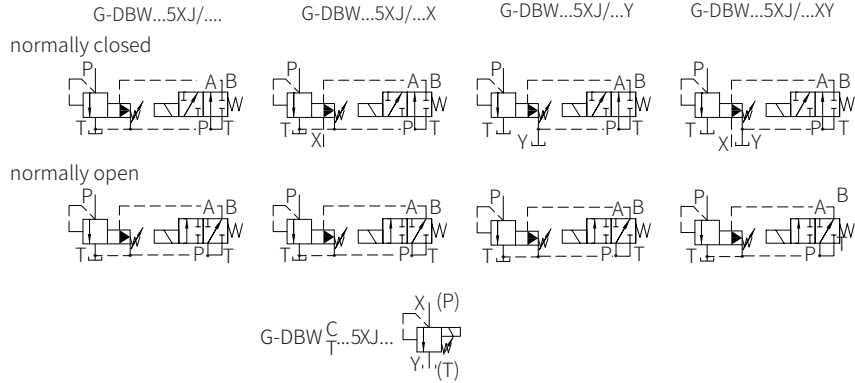

Illustration: directional valve opened

- The unloading function (directional valve function of DBW) cannot be used as safety function!
- When power off or cable breakage, Model DBW... B.. 5XJ/... should use the minimum setting pressure (circulation pressure).
- When power off or cable breakage, the pressure relief function of model DBW...A...5XJ/...is launched.
- The back pressure of pilot oil internal drain in port T or external drain in port Y is 1:1 added in pilot control pressure.

Features

- For subplate mounting
- For manifolds mounting
- 4 adjusting elements
- 4 pressure ranges
- Unload by the installed explosion-proof directional valve

Function description, sectional drawing

The G-DAW pressure control valve is pilot operated pressure shut-off valve. It is used to switch the pump flow to pressureless bypass when the accumulator loading pressure is reached. The other application of the valve is in high/low pressure pump system. In this application, the low pressure is switched to pressureless bypass when pressure reaches the high pressure setting value.

The valve is composed of main valve (1) with main spool assembly (3), pilot valve (2) with pressure adjusting element and check valve (4). For size 10 valve, the check valve (4) is installed in main valve (1). For size 25 and 32, the check valve (4) is built into a separate subplate installed under the main valve (1).

Diverting the pump flow from P to A - P to T

The pump supply oil for hydraulic system (P to A) via check valve (4). The pressure in port A acts on pilot valve spool (6) via control line (5). At same time, pressure in port P passes to the spring chamber of main spool (3) and conical spool (9) of pilot valve (2) via orifices (7) and (8). The conical spool lifts its valve seat against the spring force (10) when the setting cut-off pressure of the hydraulic system is reached. The fluid flows into spring chamber (11) via orifices (7) and (8), or the oil returns to tank external via control line (12) in model G-DAW...5XJ...Y.

Due to orifices (7) and (8), there is pressure drop in the main spool (3). The main spool (3) lifts off its seat and opens the connection from P to T. and the check valve (4) closes the connection from A to P. Now the poppet valve (9) is kept opening by the system pressure via pilot valve spool (6).

Diverting the pump fluid from P to T - P to A.

The area of the pilot spool (6) is 10% or 17% greater than the effective area of the conical spool (9), thus the effective force on the pilot valve spool (6) is 10% or 17% greater than the effective force on the conical spool (9). When the actuator pressure drop to equal the cut-off pressure of the valve that corresponds to the switching pressure differential, the spring (10) pushes the poppet valve (9) on to its seat. The pressure is built up on the spring loaded side of the main spool (3). In conjunction with spring (14), the main spool (3) is closed and the connection from port P to T is isolated. The pump flow passes again via the check valve (4) into the hydraulic system (P to A). The solenoid direction valve (15) can switch the setting shut-off pressure of the pilot valve (2) either from P to A or P to T.

Valve fixing screw
 M8x40-10.9 grade GB/T70.1-2000
 Tightening torque $M_A=34.3\text{Nm}$

Application example

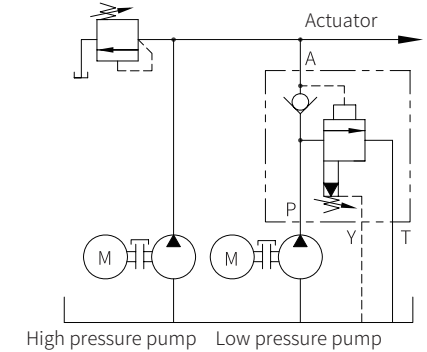

Hydraulic system with accumulator:

installation notes:

- The connection resistance between DA valve and accumulator must be as low as possible
- The pilot valve of DA is separately connected to the accumulator when the resistance is high.

Hydraulic system with high and low pressure pump:
 With high pump flow and small switching pressure differential values (10%), "Y" version valves should preferably be used.

Modular Balanced Valve

Model: PHF

Function description, sectional drawing

The PHF valve is modular balance valve. It is composed of modular valve body (1) and two plug-in counterbalance valves (2).

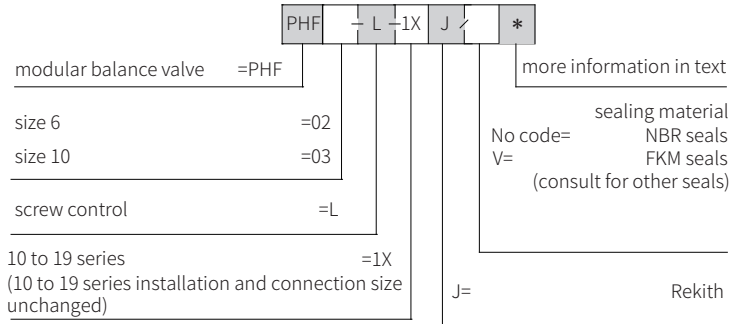

Function:

The valve allows the hydraulic oil to flow from A2 to A1 (or from B2 to B1) to lift load and keep load position unchanged. By adjusting the pressure of the control line (3) or (4) to control the opening of the valve to make the load reduced smoothly at the required speed.

If the pressure in A2 or B2 exceeds the setting pressure due to, for example, external forces or thermal expansion, the balancing overflow function is opened to avoid damage of the hydraulic actuator because of overpressure. At this time, the setting pressure is generally more than 1.3 times of the opening pressure of the main relief valve of the system to ensure that the load lifted by the maximum working pressure is not reduced because of the overflow function in normal condition.

Models and specifications

Note:

The default pilot ratio is 3:1, other pilot ratio please consult us

Function description, sectional drawing

The MG and MK valve is a restrictive valve and restrictive check valve which is related to oil pressure and viscosity.

Model MG (restrictive valve)

This valve throttles in both flow directions. The hydraulic oil flows through side hole (3) to the throttling orifice (4) which is formed by valve body (2) and adjusting sleeve (1). The cross-section of the throttling orifice (4) can be adjusted infinitely by rotating the adjusting sleeve (1).

Restrictive valve MG

Model MK (restrictive check valve)

When the fluid flows through the valve in throttling direction, the pressure oil and spring (6) presses the spool (5) onto the valve seat, then the connection is blocked. The hydraulic oil flows through the side hole (3) to the throttling orifice (4) which is formed by valve body (2) and adjusting sleeve (1).

In the opposite direction, the pressure acts on the face of the spool (5) to open the check valve and allow the fluid to flow through the check valve without throttling. At the same time, parts of the hydraulic oil flows through the annular groove to achieve the desired self-cleaning effect.

Function description, sectional drawing

The Z2FS6 type valve is a double throttle check valve with a stacked design.

This valve is used to limit the main flow or control flow of one or two working oil ports. Two symmetrically arranged throttle check valves limit the flow in one direction (by adjusting the throttle valve core) and allow free flow in the opposite direction.

For meter-in control the oil fluid flows from port A1 to A2 through the throttle port (1) which is made of the valve seat (2) and throttle spool (3). The throttle spool (3) can be axially adjusted via the adjusting screw (4) to adjust throttle port (1).

The fluid flowing back from the working oil port A2 opens the valve seat (2) against the force of spring (5) to make the valve to act as a check valve and allow free-flow. According to the installation position of the valve, the throttling effect can be meter-in or meter-out control.

Main flow limit (Z2FS6.../2Q)

To change velocity of the actuator (main flow control), the double throttle/check valve is installed between the directional control valve and the subplate.

Control flow limit (Z2FS6.../1Q)

In the pilot operated directional control valves, the double throttle/check valve is installed between the pilot valve and the main valve to control damping adjustment (control flow limit).

Function description, sectional drawing

The Z2FS10 type valve is a double throttle check valve with a stacked design.

This valve is used to limit the main flow or control flow of one or two working oil ports. Two symmetrically arranged throttle check valves limit the flow in one direction (by adjusting the throttle valve core) and allow free flow in the opposite direction.

For meter-in control the oil fluid flows from port A1 to A2 through the throttle port (1) which is made of the valve body (2) and throttle spool (3.1). The throttle spool (3.1) can be axially adjusted via the adjusting screw (4) to adjust throttle port (1). At the same time, the oil at port A1 flows through the oil hole to the spool (6) and results a pressure which force the throttle spool (3.1) in the throttle position together with the spring force.

The oil flowing back from the working oil port B2 opens the throttle spool (3.2) against the force of spring (7) to make the valve to act as a check valve and allow free-flow. According to the installation position of the valve, the throttling effect can be meter-in or meter-out control.

Main flow limit

To change velocity of the actuator (main flow control), the double throttle/check valve is installed between the directional control valve and the subplate.

Control flow limit

In the pilot operated directional control valves, the double throttle/check valve is installed between the pilot valve and the main valve to control damping adjustment (control flow limit).

As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

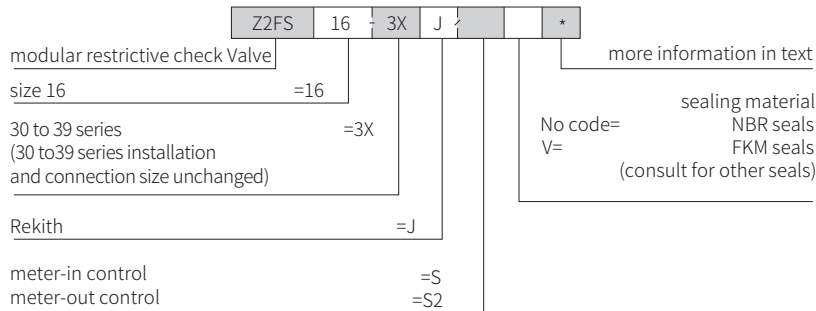

Function description, sectional drawing

2FRM model flow valve is two ways flow control valve. This valve mainly includes the valve body (1), the adjusting element (2), the throttle body (3), optional pressure compensator (4) with stroke limiter and check valve (5), it is used for the throttling of the flow from A to B at throttle port (6). The curve bolt (7) can adjust the throttling cross section. The pressure compensator needs to be connected to keep the flow constant at the throttle port (8) and without affection of pressure. The orifice is designed with sharp edges, so the throttling is not easily affected by temperature. The free flow return from B to A is via the check valve (5). The rectifier sandwich plate Z4S5-1XJ/ is installed under the flow valve to control the flow in both directions of the flow valve.

Features

- Optional pressure compensator closed externally
- Subplate mounting
- Optional check valve
- Rotary knob with scale
- Optional lock

Function description, sectional drawing

The 2FRM6 flow control valve is a two-way flow control valve. It is used to keep the constant flow and independent of pressure and temperature. The valve mainly consists of the valve body (1), rotary knob (2), orifice (3), pressure compensator (4) and an optional check valve.

Flow control valve model: 2FRM6B... -3X/ ...MV
(without external closing, without check valve)

The flow from the oil port A to B is throttled at the throttle position (5). The throttle cross-section is adjusted by turning the rotary knob (2). In order to keep the flow constant and independent of pressure, a pressure compensator (4) is required to be installed in port B downstream of the throttle position (5).

The compression spring (6) presses the orifice (3) and pressure compensator (4) to their limited positions respectively and thus keeps the pressure compensator (4) in the open position when there is no flow through the valve. When the fluid flows through the valve, the pressure at port A acts to the pressure compensator (4) through the orifice (7). The pressure compensator (4) moves to the compensation position until force balance. If the pressure in oil port A increases, the pressure compensator (4) moves to the closed direction until the force balance is reached again.

Because the pressure compensator continuously acts as compensation, the flow can be maintained. In order to control the flow in both directions, the rectifier sandwich plate Z4S6 can be installed under the flow control valve.

Model 2FRM6B76-3XJ/...M

Function description, sectional drawing

This flow valve is provided with the possibility of an external closing of the pressure compensator (4) through channel P(9).

The external pressure acting in the channel (9) via orifice (10) to hold the pressure compensator (4) closed against the force of the spring (6). When the direction valve (11) in the middle position is switched from P to B, the valve can be used same load compensation function as model 2FRM6B to avoid the jump at start-up. This version with external closing of the compensator can only be used for the supply control. The fluid flows freely from port B to A through the check valve (8).

Component size	06-07

Features

- Optional pressure compensator stroke limiter
- Start-up jump reduction
- Lockable knob
- Flow control in both direction by means of rectifier sandwich plate

Function description, sectional drawing

2FRM model flow valve is two ways flow control valve which is composed of the pressure reducing valve and the throttle valve in series.

When the oil fluid flows into the valve, it is reduced pressure through the pressure reducing valve first and then throttled by the throttle valve. The flow of the flow valve is stable and unaffected by load changing because of the pressure compensation provided from the pressure reducing valve to the throttle valve. At the same time, the orifice is designed into thin blade shape to make little influence to the flow by temperature changing. When the flow valve and check valve is connected in parallel, the oil fluid can flow back in the opposite direction.

The rectifier sandwich plate Z4S is installed under the flow valve, it can stabilize the flow in both directions of the flow valve.

Function description, sectional drawing

The Z2FRM6 valve is modular type two-way flow control valve and the 2FRM6K valve is cartridge type two-way flow control valve.

The Z2FRM6 flow control valve is used to maintain constant flow and independent of the pressure and temperature. It mainly includes the valve body (1) and one or two flow control valve model 2FRM6K (9).

The throttling of the flow from the oil port A2/B2 (A) to the oil port A1/B1 (B) occurs at the throttle area (3). The throttle rod (4) is driven by the adjustment element (2). In order to keep the flow in the oil port A1/B1(B) constant and independent of pressure, a pressure compensator (5) is required to be installed downstream of the throttle area (3). The compression spring (7) presses the pressure compensator (5) against the plug screw (8) and holds the pressure compensator in the open position when there is no flow through the valve. When the fluid flow through the valve, the pressure at oil port A2/B2(A) acts to the pressure compensator (5). Then the pressure compensator (5) moves until the forces balance. If the pressure on the oil port A2/B2 (A) increases, the pressure compensator (5) moves to the closed direction until force balance is reached again. Because the pressure compensator (5) continuously acts as compensation, the flow can be maintained.

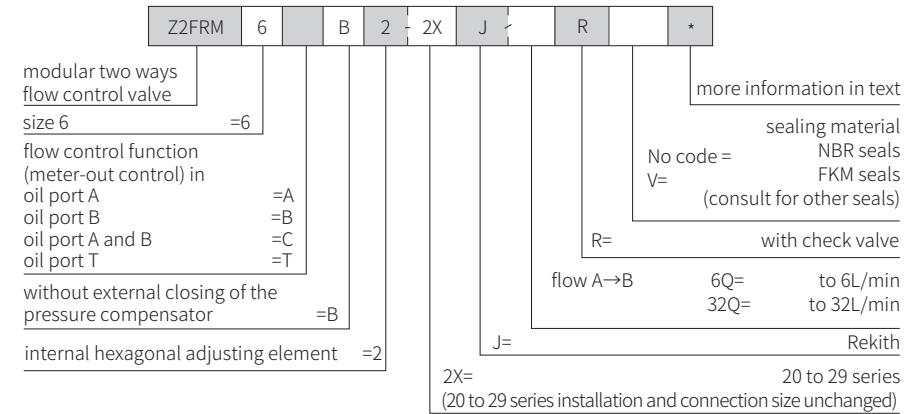

The fluid flows freely from oil port A1/B1 (B) to A2/B2 (A) via check valve (6).

As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The balanced valve is used to prevent "out of control" of hydraulic cylinder or motor caused by load in hydraulic system. It can also prevent pipe bursting.

The balanced valve mainly includes the valve body (1), main spool (2), pilot part (3), control spool (4), damping spool (5) and orifice (6). When lifting load, the fluid flows from A to B to open the main spool (2). If the load pressure fails (e.g. pipe break), the main spool closes immediately as the chamber (8) is connected with load pressure.

Lowering the load (circuit examples)

The direction of flow is from B to A. Port A is connected to tank through the directional valve. The piston rod side of the cylinder has a flow applied which corresponds to the working condition. The relationship between the control pressure at port X and the load pressure at port B is 1:20.

When the control pressure is reached, the main spool opens. The pilot body (3) is lifted off its seat by the control spool (4), and the chamber (8) is decompressed by its inner hole and port A to tank. At the same time, the load pressure in port B doesn't act on the chamber (8) any more due to the longitudinal movement of the pilot part (3) within the main spool. Then the main spool (2) is unloaded. The reverse side of the control spool (4) at the main spool (2) lies against the collar of the damping spool (5).

To open the main spool, the control pressure in port X depends on the spring in the chamber (9). When the valve opens, the pressure is 20bar, and it is 50bar when fully open. The relationship between the opening area, cracking pressure and differential pressure determines the flow to the actuator via the connection of B to A. It depends on the inlet flow on the other side of the actuator to prevent the actuator "runaway". The operation of the controlled lowering is not affected even if there is a pipe break between the directional valve and port A in the balanced valve.

Note on the opening and closing times of balanced valve:

- Throttling of the opening sequence is via orifice (6) in the control spool (4) and both sides of the damping spool (5).
- The closing of the balanced valve is almost no throttling.
- When being used together with cylinder, a throttle check valve (meter-out control) can be set in the control line of port X to affect the closing time.
- When being used together with the motor, a throttle check valve should not be set in the control line of port X, in this condition it is recommended to control the closing time of the direction valve.

0646

Circuit examples

Cylinder with single rod

For safety, a closed center directional valve should be always used.

Note:

Two balanced valves can not be used to control two mechanically synchronized cylinder as it is impossible to maintain the same synchronized pressure in two cylinders. Therefore, it is necessary to install two hydraulic operated check valves type SL in the cylinder, and the balanced valve is installed in the common line. In this case, the load pressure can not exceed 200bar.

In order to avoid shaking caused by the loss of pressure at control port X because of fast falling speed, it is recommended to install a throttle check valve at port A of the balanced valve to limit the falling speed.

Hydraulic motor

To make sure the brake can be operated, the two oil ports of the directional valve must be connected to the tank in the neutral position. If the brake is externally operated, then it could use a closed central directional valve.

Valves for manifold mounting (cartridge valves)

- 1 Control oil port
 - 2 Name plate
- Oil ports A and B can be arranged as required. But the valve fixing screw holes must not be damaged.

Note:
The cartridge valve is an incompact structure but not integral, please refer to the sectional drawing when installing: fix the valve sleeve with thread firstly, then fix other parts, finally fix the cover.

Function description, sectional drawing

The 4WRA(E) valve is a 4/2-way and 4/3-way proportional directional valve with direct operated and subplate mounting. It is actuated by proportional solenoids with central thread and detachable coil. The control of the solenoids can be achieved through external amplifier (4WRA) or internal amplifier (4WRAE).

Structure:

The valves consist of:

- Valve body with mounting surface (1)
- Control spool (2) with compression springs (3 and 4)
- Solenoids (5 and 6) with central thread
- Optional amplifier (7)

Operating principle:

- When the solenoids (5 and 6) are de-energized, the compression springs (3 and 4) hold the control spool (2) in the central position.
 - The control spool (2) is pushed to the left in proportion to the electrical input signal.
 - At this time, P to A and B to T are connected through the orifice formed by the spool and the valve body with progressive flow characteristics.
- De-energization of solenoid (6)
 - The control spool (2) is pushed back to the center position by the compression spring (3).

Model 4WRA6...2XJ

Function description, sectional drawing

Two Position Valves:

(Model 4WRA...A...)

In principle, the function of this valve is similar to the valve with three-position, but it is installed with solenoid "a" only. A plug (8.1 for NG6 and 8.2 for NG10) is installed instead of the proportional solenoid "b".

Note for model 4WRA- 2XJ/...

It must be avoided to drain all the oil in the return line. If necessary, a back pressure valve is to be installed in the circuit (back pressure about 2 bar).

Terminal identification of plugs

Terminal identification	contact	A1 signal	F1 signal
Supply voltage	A	24VDC(19~35V)	
	B	GND	
	C	no connection ¹⁾	
Differential amplifier input	D	$\pm 10V, Re > 50K \Omega$	4~20mA, $Re > 100 \Omega$
	E	Reference potential	
	F	no connection ¹⁾	

Command value:

A positive command value 0 to +10V (or 12 to 20mA) at D and E causes a flow from P to A and B to T.

A negative command value 0 to -10V (or 12 to 4mA) at D and E causes a flow from P to B and A to T.

For valves only with one solenoid in side "A" (symbols EA and WA), a positive command value at D and E causes a flow from P to B and A to T.

Connecting cable:

Recommendation:

Cable length up to 25m, model LiYCY 5x0.75mm²

Cable length up to 50m, model LiYCY 5x1.0mm²

The external diameter of the cable is 6.5 to 11mm

The connection of screen to PE on the supply side only.

¹⁾ Contacts C and F are not allowed to be connected together.

Proportional Directional Valve

Model: 4WRE(E)...2XJ

- ◆ Size 6 and 10
- ◆ Maximum working pressure 315 bar
- ◆ Maximum working flow 80 L/min (size 6)
180 L/min (size 10)

Contents

Function description, sectional drawing	02-03
Functional symbols	03
Models and specifications	04
Technical parameters	05
Characteristic curve	06-11
Component size	12-15

Features

- proportional directional valve with direct operated proportional solenoid
- For subplate mounting
- Control the direction and flow
- Spring centred control spool
- Internal amplifier, current input A1 or F1, optional
- Operated by proportional solenoids with thread and detachable coil
- Both valves and proportional amplifiers from the same supplier

Function description, sectional drawing

The 4WRE(E) valve is a 4/2-way and 4/3-way proportional directional valve with direct operated and subplate mounting. It is actuated by proportional solenoids with central thread and detachable coil. The control of the solenoids can be achieved through an external amplifier (4WRE) or internal amplifier (4WREE).

Structure:

The valves consist of:

- Valve body with mounting surface (1)
- Control spool (2) with compression springs (3 and 4) and spring seats (X1 and X2)
- Solenoids (5 and 6) with central thread
- Position sensor (7)
- Optional amplifier (8)
- Mechanical zero adjustment (9) accessible by Pg13.5, electrical zero point adjustment (10) accessible by Pg7 for model 4WREE

Operating principle:

- When the solenoids (5 and 6) are de-energized, the compression springs (3 and 4) hold the control spool (2) in the central position between spring seats (X1 and X2)
 - After the proportional solenoid is energized, it will directly push the control spool (2), e.g. energization of solenoid "b" (6):
 - The control spool (2) is pushed to the left in proportion to the electrical input signal
 - At this time, P to A and B to T are connected through the throttle formed by the spool and the valve body with progressive flow characteristics
 - De-energization of solenoid (6)
 - The control spool (2) is pushed back to the center position by the compression spring (3)
- In the de-energized condition, the spool (2) is held in the mechanical central position via the reset springs. There is no related to the hydraulic central position for the spool symbol "V". When the valve control loop is closed, the spool is in the hydraulic central position.

Model 4WRE6...2XJ

Function description, sectional drawing

Two Position Valves:

(Mode I4WRE...A...)

In principle, the function of this valve is similar to the valve with three-position, but it is installed with solenoid "a" only. A plug 8.1 is installed instead of the proportional solenoid "b".

Note for model 4WRE6...-2XJ/...:

It must be avoided to drain all the oil in the return line. If necessary, a back pressure valve is to be installed in the circuit (back pressure about 2 bar).

Electrical connections

Model 4WRE...2XJ/...(Without built-in amplifier)

Component plug connection form

The plug-in connector to DIN175301-803 or ISO4400

Component plug connection form

Inductive position sensor

Plug connector 4-pin Pg7-G4W1F

Connecting cable:

Recommendation:

Cable length up to 50m, model LiYCY 4x0.25mm²

The connection of screen to PE on the supply side only.

Model 4WREE...2XJ/...(With built-in amplifier)

The plug-in connector to DINEN 175201-804

Electrical connections

Model 4WREE...(With built-in amplifier)

Plug allocation

Terminal identification	Contact	A1 signal	F1 signal
Supply voltage	A	24VDC (u (t) =19.4 to 35V), I _{max} =2A	
	B	0V	
Reference potential (actual value)	C	Reference contact F, R _e >50K Ω	Reference contact F, R _e >10K Ω
Differential amplifier input	D	±10V, R _e >50K Ω	4 to 20mA, R _e >100Ω
	E	Reference potential command value	
Measurement output (actual value)	F	Actual value ± 10V (limit load 5mA)	Actual value 4 to 20mA (maximum load resistance 300 Ω)
	PE	Connected with the valve body and cooling element	

Command value:

A positive command value 0 to +10V (or 12 to 20mA) at D and E causes a flow from P to A and B to T.

A negative command value 0 to -10V (or 12 to 4mA) at D and E causes a flow from P to B and A to T.

For valves only with one solenoid in side "A" (symbols EA and WA), a positive command value at D and E causes a flow from P to B and A to T.

Actual value:

A positive actual value 0 to +10V (or 12 to 20mA) at F and C causes a flow from P to A and B to T.

A negative actual value 0 to -10V (or 4 to 12mA) at F and C causes a flow from P to B and A to T.

For valves only with one solenoid in side "A" (symbols EA and WA), a positive actual value at F and C causes a flow from P to B and A to T.

Connecting cables:

Recommended:

Cable length up to 25m, model LiYCY 5x0.75mm²

Cable length up to 50m, model LiYCY 5x1.0mm²

The external diameter of the cable is 6.5 to 11mm

The connection of screen to PE on the supply side only.

Electro-hydraulic Proportional Directional Valve

Model: 4WRZ(E)...7XJ

- ◆ Size 10 to 32
- ◆ Maximum working pressure 350 bar
- ◆ Maximum working flow 1600 L/min

Function description, sectional drawing

Pilot control valve model 3DREP6...

This pilot valve is a three-way pressure reducing valve controlled by a proportional solenoid. It converts an input signal into a proportional pressure output signal and is used for all valves model 4WRZ...

The proportional solenoids are adjustable, DC wet pin solenoids with central threads and detachable coils. The solenoids are controlled by external amplifier (model WRZ...) or internal amplifier (mode 4WRZE...)

Structure:

The valves consist of:

- Valve body with mounting surface (1)
- Control spool (2) with pressure measuring spools (3 and 4)
- Solenoids (5 and 6) with central threads
- Optional amplifier (7)

Operating Principle:

● When the solenoids (5 and 6) are de-energized, the compression spring (8) holds the control spool (2) in the central position.

● After the proportional solenoid is energized, it will directly push the control spool (2), e.g. energization of the solenoid "b" (6):

→The control spool (2) and pressure measuring spool (3) are pushed to the left in proportion to the electrical input signal.

→At this time, P to A and B to T are connected through the throttle formed by the spool and the valve body with progressive flow characteristics.

● De-energization of solenoid (6)

→The control spool (2) is pushed back to the central position by the compression spring (8). In the central position of the pilot valve, A and B are connected to T, that means the hydraulic fluid can flow to the tank directly.

Model 3DREP6...-2XJ/

Function description, sectional drawing

Note for model 3DREP6...

It must be avoided to drain all the oil in the return line. If necessary, a back pressure valve is to be installed in the circuit (back pressure about 2 bar).

Model 3DREP6...-2XJ/

Two position valve (model 3DREP... B...)

In principle, the function of this valve is similar to the valve with three-position. The two position valve is installed with solenoid "a" (5) only, and a screw plug (9) is installed at the position of the second solenoid.

Pilot operated proportional directional valve model 4WRZ...

The 4WRZ valve is pilot operated 4-way directional valve which is controlled by proportional solenoids, it controls the direction and size of the flow.

Structure:

The valves consist of:

- Pilot control valve (9) with proportional solenoids (5 and 6)
- Main valve (10) with main valve spool (11) and compression spring (12)

Operating principle:

When the solenoids (5 and 6) are de-energized, the compression spring (12) holds the main valve spool (11) in the central position.

→The action of the main valve spool (11) is controlled by the pilot valve (9), the main valve spool is proportional moved, e.g. by means of solenoid "b" (6).

Model 4WRZE16...-7XJ/..

→Firstly, the control spool (2) is pushed to the right, the pilot oil is fed through the pilot valve (9) into the pressure chamber (13) and moves the main spool (11) in proportion to the electrical input signal.

● At this time, P to B and A to T are connected through the throttle formed by the spool and the valve body with progressive flow characteristics.

● The pilot oil required for the pilot valve can be supplied internally through port P or externally through port X.

→When the solenoid (6) is de-energized, the control spool (2) and main valve spool (11) will return to the central position.

● Depending on the different position of the main valve spool, P to A and B to T or P to B and A to T are connected. The optional manual emergency operations (14 and 15) with protective cap allow the pilot valve (2) to move when the solenoid is not energized.

Attention! Inadvertent activation of manual emergency operation may cause the equipment movement out of control.

Terminal identification of plugs

Terminal identification	Contact	A1 signal	F1 signal
Supply voltage	A	24VDC(19~35V)	
	B	GND	
	C	no connection ¹⁾	
Differential amplifier input	D	$\pm 10V, R_e > 50K \Omega$	4~20mA, $R_e > 100 \Omega$
	E	Reference potential	
	F	no connection ¹⁾	

Command value:

A positive command value 0 to 10V (or 12 to 20mA) at D and E causes a flow from P to A and B to T.
 A negative command value 0 to -10V (or 12 to 4mA) at D and E causes a flow from P to B and A to T.
 For valves only with one solenoid in side "A" (symbols EA and WA), a positive command value at D and E causes a flow from P to B and A to T.

Connecting cable:

Recommendation:

Cable length up to 25m, model LiYCY 5x0.75mm²

Cable length up to 50m, model LiYCY 5x1.0mm²

The external diameter of the cable is 6.5 to 11mm

The connection of screen to PE on the supply side only.

¹⁾Contacts C and F are not allowed to be connected together.

Function description, sectional drawing

Pilot control valve model 4WRAP6W7...3XJ/G24... (1st stage)

This valve is a direct operated proportional valve. The dimensions of control edge is designed and optimized for the use as a pilot control valve for proportional directional valves model 4WRKE.

The proportional solenoids are oil-immersed DC solenoids with detachable coils. They convert the electric current proportionally into mechanical force. The increase of electric current cause the correspondingly higher of solenoid force. During the whole adjustment stroke, the set solenoid force remains unchanged.

The pilot control valve mainly consists of the valve body (1), proportional solenoids (2 and 3), valve spool (4), and springs (5 and 6).

When the solenoid is de-energised, the working oil ports are connected to the oil tank. If one of the two solenoids (2 or 3) is energised, the solenoid force moves the valve spool (4) against the spring (5 or 6). Once the overlap area is overcome, one of the two working oil ports connected to the oil tank is blocked and will connect to the pressure chamber. Then the fluid flows from P to the control chamber of the main stage.

Model 4WRAP6W7-3XJ/G24...

Function description, sectional drawing

The 4WRKE valve is a two-stage proportional directional control valve. They control the size and direction of the flow. The main stage is position closed loop controlled so that the valve spool position is independent of the hydraulic force in larger flows.

The valve consists of the pilot control valve (1), valve body (8), main valve spool (7), covers (5 and 6), centering spring (4), inductive position sensor (9), and pressure reducing valve (3).

If there is no input signal, the main valve spool (7) is held in the central position by the centering spring (4). The two control chambers in the covers (5 and 6) are connected to the oil tank through the valve spool (2).

The main valve spool (7) is connected to the corresponding electronic amplifier through the inductive position sensor (9), the change of position of the main valve spool (7) as well as the change of the command value at the summing point of the amplifier result in a differential voltage.

The control deviation is obtained by comparing the command value/ actual value through the electronic and a current is supplied to the proportional solenoid of the pilot valve (1).

The current induces solenoid force within the solenoid and transmit it to the solenoid push rod to push the control valve spool. The flow through the control port causes the main spool to move.

The main valve spool (7) with the solenoid core induction position sensor (9) continues to move until the actual value and command value are equal.

Under the condition of closed loop control, the main valve spool (7) is in force balanced and remained in the control position.

The changes of valve spool stroke and the control valve opening are proportional to the command value. The electronic control amplifier is built into the valve.

It must be avoided to drain all the oil in the return line. If necessary, a back pressure valve is to be installed in the circuit (back pressure about 2 bar).

Model 4WRKE16...-3XJ/

Valve characteristics

- The second stage is basically composed of our proportional valve components.
- The zero point adjustment of the "main stage zero point" is preset by the manufacturer, and can be adjusted within range of $\pm 30\%$ of the nominal stroke through the potentiometer inside the electronic control. The integrated electronic control can be operated by removing the plug at the end of the valve cover.
- When replacing the pilot control valve or electronic controller, it must be readjusted. Any adjustment must be carried out by trained experts.

Features

- Sandwich plate type
- Load compensation at the oil port P to A or P to B via built-in shuttle valve
- Two-way version "P"
- Flow control when work with proportional directional valves
- The mounting surface according to the standard DIN24 340 A

Function description, sectional drawing

The ZDC valve is a direct operated supply pressure compensator with two-way design. The valve is mainly composed of the valve body (1), control spool (2), pressure spring (3), two dampers (4), and end cover (5) with integral shuttle valve (6).

As same with all cross sections of throttle valve, the volume flow of proportional throttle valve and directional control valve depends on the differential pressure ΔP . The combination of the throttle valve and pressure compensator results the load-compensated electric flow control valve to keep the differential pressure ΔP at the throttle valve constant. The pressure difference is determined by the spring of the pressure compensator and depends on the select model when pressure between 8 and 25bar.

When the differential pressure from P1 to A1 or P1 to B1 is less than the spring force, the compression spring (3) holds the control spool (2) from P2 to P1 in the open position. If the differential pressure exceeds the spring force, the control spool (2) moves to the left until the differential pressure is restored.

Function description, sectional drawing

Overview

Model DBETE (Integrated Electronic Control)
The function and design of this valve are the same as the DBET type. There is an additional plug type proportional amplifier (6) on the proportional solenoid, which is included in the electronic control.
The plug (7) receives power and command value.
The command value pressure characteristic curve is pre-set by the manufacturer based on the principle of minimum manufacturing tolerance.
For more detailed instructions on integrated electronic controllers, please refer to the instructions.

Operating Principle:

The system pressure is regulated by the command value of the electronic controller which supplies a current to the solenoid based on the command value. The proportional solenoid converts the current into mechanical force and acts on the poppet valve (4) through the armature pin (5). The poppet valve (4) presses on the valve seat (3) directly, thereby closing the connection from port P to T.
If the hydraulic force on the poppet valve (4) is equal to the solenoid force, then the valve controls the set pressure by lifting the poppet valve (4) off the valve seat (3), and thus allowing the pressure fluid flows from port P to T. The minimum setting pressure is set with minimum control current related to the zero command value.

Model DBET-6X/J/

Model DBETE-6XJ/

Model DBETE (Integrated amplifier)

The function and design of this valve is same as model DBET.
There is an additional plug type proportional amplifier (6) with electric controller on the proportional solenoid. The connector (7) receives power and command value. The command value pressure characteristic curve is pre-set based on the minimum manufacturing tolerance principle by the manufacturer. For more detailed information on the integrated amplifier, please refer to the instructions.

As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The DBETR proportional relief valve is a remote control valve and direct operated pressure relief valve of poppet design. The valve adjusts the pressure in proportion to the electrical command value.

The valve consists of the valve body (1), proportional solenoid (2) with inductive positional transducer (3), valve seat (4) and valve poppet (5). The pressure is set by adjusting the command value potentiometer (0 to 9 V). Adjusting the command value causes tensioning of the compression spring (6) via controlling the electronic element and the proportional solenoid (2). Tensioning of the compression spring (6), i.e. the position of the spring plate (7) is measured by the inductive positional transducer (3). The deviations from the command value are corrected by the closed loop positional control. The use of this principle eliminates the effect of solenoid friction.

Advantages:

- Low hysteresis
- Good repeatability

When the command value of the proportional solenoid is zero or power failure or the cable breakage at the positional transducer, it must be adjusted to the minimum settable pressure.

Note!

In order to ensure optimum valve function of the valve, it should be bled when valve used:

- Remove item 8
- Fill the oil into the open screw hole at item 8
- Re-screw the item 8 when no more bubbles appear
- It must be avoid the emptying running of tank.

In some installation conditions, a back pressure valve is to be installed (back pressure approx. 2 bar).

Features

- For subplate mounting
- For installation in manifolds
- Maximum pressure limitation
- Both valves and proportional amplifiers from the same supplier

Function description, sectional drawing

The DBEM and DBEME valves are pilot operated proportional relief valves and used to limit the hydraulic system pressure. The pressure in hydraulic system can be adjusted according to the electric command value by these valves.

They basically consist of the main valve body (1) with main valve spool (3), pilot control valve (2) and the solenoid pilot valve (11).

Model DBEM

The pressure at the P port acts on the bottom of the main valve spool (3), and also acts on the spring loaded side of the main valve spool (3) by orifices (6,7) and plug-in damping (4,5). The pressure is applied to the needle valve (10) of the solenoid pilot valve (11) through the control hole (9) to counteract the output force of the proportional solenoid (12) according to the set value. If the hydraulic pressure exceeds the output force of the proportional solenoid, the needle valve (10) opens. The pilot oil flows into port Y through orifice (13) and returns to the oil tank. Subsequently, The pressure drop is formed from orifices (6,7) and against the force of the return spring to lift the main valve spool (3). The port P is connected to port T. The main valve spool (3) controls the pressure at the P port.

An additional spring loaded pilot control valve (2) is required to limit the maximum pressure (pressure protection function). The conical valve (15) and pilot valve seat (17) are closed due to the force of the spring (16).

If the pressure in the spring chamber of the main valve spool (3) exceeds the maximum allowable setting pressure of the valve, the conical valve (15) overcomes the force of the return spring to open and connect the oil circuit to the spring chamber. The pressure oil returns to the oil tank via port Y. The pressure drop is formed from orifices (6, 7) and overcome the force of the return spring to lift the main valve spool (3). The connection from port P to port T is opened. The main valve spool (3) controls the pressure at the port P.

The pre-set pressure can be reduced by the adjusting sleeve (19) if necessary. Port Y must return to the oil tank from the external pipeline, and there is no pressure in the return pipeline layer. The valve unloads and limits the maximum pressure through port X (18).

Function description, sectional drawing

Model DBE/ZDBE

The DBE and ZDBE proportional relief valves are operated by a proportional solenoid. These valves are used to limit the system pressure. It can adjust the system pressure steplessly to be limited based on the electrical command value.

The valve mainly consists of proportional solenoid (1), valve body (2), valve components (3), valve spool (4) and pilot cone head (8). The proportional solenoid converts the current into mechanical force proportionally. The increase in current intensity correspondingly causes an increase in the magnetic force. The armature cavity of the solenoid is filled with oil and maintains pressure balance.

The system pressure is set by the proportional solenoid (1) according to the command value. The pressure in port P acts on the right side of the valve spool (4). At the same time, the system pressure acts on the spring-loaded side of the valve spool (4) through the control line (6) with orifice (5). The system pressure acts on the pilot cone head (8) through another orifice (7) in relative to the mechanical force of the proportional solenoid (1). When the system pressure reaches the pre-set value, the pilot cone head (8) is lifted from the valve seat. Then the control oil can drain (according to the model) externally via port A(Y) or internally into the tank to limit the pressure on the spring-loaded side of the valve spool (4). If the system pressure continues to increase slightly, the higher pressure on the right will push the valve spool to the left to the control position P to T. At the minimum control current (corresponds to the command value of zero), the minimum setting pressure will be set.

Note:

In order to ensure optimum valve function of the valve, it should be bled when valve used:

- Remove the bleed bolt (9),
- Fill the oil into the screw hole at position 9,
- Re-screw the position 9 when no more bubbles appear.
- It must be avoided the emptying running of the tank. In some installation conditions, a back pressure valve is to be installed (back pressure about 2bar)

Model DBE...K4

Model DBEE...K31...and ZDBEE...K31...(with integrated electronic OBE)

In principle, the function and structure of this valve is similar to the valve DBE and ZDBE, but just take a connector (10) with integrated electronic (OBE) on the proportional solenoid.

Both the supply power and command value voltage are configured on the cable socket (11).

3-Way Proportional Pressure Reducing Valve

Model: 3DREP(E)6...2XJ

- ◆ Size 6
- ◆ Maximum working pressure 100 bar
- ◆ Maximum working flow 15 L/min

Contents

Function description, sectional drawing	02
Functional symbols	03
Models and specifications	03
Technical parameters	04-05
Characteristic curve	05
Component size	06-07

Features

- Direct operated proportional valves for the control of the pressure and direction of a flow
- Operation by proportional solenoid with central thread and detachable coil
- For subplate mounting
- Spring centred control spool
- Model 3DREPE with integrated amplifier
- Model 3DREP with external amplifier
- Manual emergency operation, optional

Function description, sectional drawing

The 3DREP6 type 3-way pressure reducing valve is direct operated by proportional solenoid. It is used to convert an electrical input signal into a proportional pressure output signal. The proportional solenoids are controllable wet pin DC solenoids with central thread and detachable coil. The solenoids are controlled by external amplifier (model 3DREP) or integrated amplifier (model 3DREPE).

The valves consist of:

- Valve body with mounting surface (1)
- Control spool (2) with pressure measuring spool (3)
- Solenoid with central thread (5) (6)
- Optional integrated amplifier (7)

Function:

- When the solenoid is de-energized, the control spool (2) is held in its neutral position by the compression spring.
- After one of solenoid is energized, the control spool(2) is directly actuated.

E.g. energization of solenoid "a" (6)
 → the pressure measuring spool (3) and the control spool (2) is pushed to the right in proportion to the electrical input signal.
 → P to B and A to T are connected through the cross-sections with progressive flow characteristics.
 De-energization of solenoid (5).
 → the control spool (2) is pushed back to the center position by the compression spring.
 In the middle position the connections from A and B to T are open, therefore, the pressure oil can freely flow to tank. An optional manual emergency operation is required to move the control spool (2) without solenoid energization.

Attention:

The unconscious activation of manual emergency operation can cause uncontrolled movement of equipment!

Model 3DREP6...-2XJ/...

Model 3DREPE6...-2XJ/...

Note:

To prevent leakage of tank lines, a back pressure valve is required to install (back pressure about 2 bar) according to the installation condition.

Valve with 2 positions:
 (Model 3DREP.. A... or 3DREP.. B...)

The function of this valve is basically the same as the valve with three positions, but the two position valve is only installed with solenoid "a" or "b", and with a plug (9) instead of the second solenoid.

Function description, sectional drawing

The DRE (M) valve is a pilot operated pressure reducing valve, it is used to reduce working pressure. The valve mainly consists of pilot valve (1) with proportional solenoids (2), main valve (3) with a main spool insert (4), and an optional check valve (5).

Model DRE

The pressure at port A acts on the surface (7) of the main spool via throttle (6). The pilot oil flows from port B through the throttle (8) to the constant flow controller (9) which can keep the pilot flow constant away from the pressure drop between port A and B. The pilot oil flows from the constant flow controller (9) to the spring chamber (10), via throttles (11 and 12) and valve seat (13) to port Y(14, 15, 16) and from there to the tank. The pressure required in port A is controlled by the relevant amplifier. The proportional solenoid pushes the conical valve (20) towards the valve seat (13) to limit the pressure of the spring chamber (10) to the setting value. If the pressure at Port A is lower than the setting value, the pressure difference in the spring chamber (10) pushes the main spool to the right, thereby the connection from Port B to Port A is opened.

When the required pressure in port A is achieved, the force at the main spool is balanced and the main spool is maintained in the working position.

The pressure in port A X spool area (7) = spring chamber (10) pressure X spool area - spring force (17). If the pressure built up by the pressure liquid column (e.g. cylinder piston to stop) at port A is to be reduced, it need to adjust a lower command value in the relevant amplifier, and then the lower pressure will be built up in the spring chamber (10).

The higher pressure at port A acts on the face (7) of the main spool and pushes the main spool towards the plug (18). The connection from A to B is closed but A to Y is opened. The force of the spring (17) is used to balance the hydraulic pressure acting on the face (7) of the main spool. At this main spool position, the oil flows from port A to port Y through the control edge (19) into the return pipeline.

When the pressure at port A reduces to the pressure of the spring chamber (10) plus the pressure difference Δp on the spring (17), the main spool at the control edge A to Y closes the large control bores in the socket. The remaining pressure difference about 10 bar for the set pressure at port A can only be unloaded by control channel (21), thus it can achieve a perfect transient response performance without pressure sudden changes.

To ensure the fluid flows freely from port A to port B, a check valve (5) can be selected. Parts of the oil from port A will flow into port Y through the control edge (19) of the main valve spool into the return pipeline.

Model DREM

To prevent the unexpected increase of the control current due to the proportional solenoid, which cause an increase in pressure at port A and may affect the safety of the hydraulic system, it can optionally to install a spring-loaded pressure relief valve as maximum pressure limitation (22) for maximum pressure protection of the system.

Model DREM- 6XJ/ YG24K24 (with check valve)

Function description, sectional drawing

Model DRE (M) E (with integrated amplifier)

The function and design of this type valve is exactly the same as the DRE (M) valve if without integrated amplifier. The amplifier is located in the connector (23), and supplies power and receives the command value voltage by plug-in type (24). The set value - pressure characteristic curve is pre-set by the manufacturer based on the principle of minimum manufacturing tolerance.

Function description, sectional drawing

The 3DRE (M) and 3DRE (M) E type valves are solenoid operated pilot 3-way pressure reducing valves with pressure protective function for the actuator. They are used to reduce (P to A) and limit (A to T) the pressure of the system.

Structure:

The valve mainly consists of:

- Pilot valve (1) with proportional solenoid (2), and optional maximum pressure limitation (15)
- Main valve (3) with main spool (4)

Function:

- The reduced pressure is set through the pilot valve (1) in port A according to the set value.
- When pressure reducing in port P, the main spool (4) is hold in the central position by springs (5) and (6) to prevent a start-up jump during valve working.
- The control fluid flows from orifice (7) via the flow controller (8) and chamber (11) to the throttle gap (9), and via channel (10) to the port Y. This connection is to be led into the tank at zero pressure.

Pressure reducing:

- Build-up of the pilot pressure in the chamber (11) as a function of the command value.
- The pressure is formed by nozzle (12) in the spring chamber (13) and move the main spool (4) to the right, then the fluid flows from P to A.
- The actuator pressure in port A is available in the spring chamber (14).
- Increase the pressure in port A to the set pressure of the pilot valve (1) to move the main spool (4) to the left. The pressure in port A is almost same with the set pressure at the pilot valve (1).

Pressure limitation:

- If the pressure in port A exceeds the set value pressure of the pilot valve (1), then the main spool (4) continue moves to the left.
- The connection from A to T is open and the pressure in port A is limited to the set command value.

Model 3DREM:

In order to prevent an impermissible high control current on the proportional solenoid by means of hydraulic restraint, which will inevitably cause excessive pressure in port A, then you can optional install a spring-loaded pressure limiting valve as a maximum pressure limitation (15). The maximum pressure limitation can be pre-set according to the corresponding pressure rating (see "Technical Data").

Model 3DRE...-.../...XY Pilot oil external supply
Pilot oil external drain

In this version, the pilot oil is supplied from a separate control circuit (external).
The pilot oil drain is not directed to the port T of the main valve, but return to the tank via port Y (external).

Model 3DRE...-.../...Y... Pilot oil external supply
Pilot oil external drain

In this version, the pilot oil is supplied from port P of the main valve (internal).
The pilot oil drain is not directed to the port T of the main valve, but return to the tank via port Y (external).
Port X in the subplate must be closed.

2-Way Proportional Flow Control Valve

Model: 2FRE6...2XJ

- ◆ Size 6
- ◆ Maximum working pressure 210bar
- ◆ Maximum working flow 25 L/min

Contents

Function description, sectional drawing	02
Models and specifications	03
Functional symbols	03
Technical parameters	04-05
Characteristic curve	06-07
Component size	08

Features

- With pressure compensation for the pressure compensated control a flow
- Operation by proportional solenoid
- With electrical position feedback of control throttle
- The position transducer coil is axially adjusted to make the zero position adjustment of the throttle port easy (electrical, hydraulic)
- Flow control in both directions via rectifier sandwich plate

Function description, sectional drawing

The 2FRE...proportional flow control valves have a 2-way function. They can control a corresponding flow independent of pressure and temperature according to the provided electrical command value. The valve basically consists of valve body (1), proportional solenoid with inductive position transducer (2), measurement orifice (3), pressure compensator (4), and optional check valve (6).

Proportional flow control valve model 2FRE6B-2XJ/ (without external closing, with check valve)

The setting of the flow (0 to 100%) is determined by the command value potentiometer. The applied command value adjusts the measurement orifice (3) via the amplifier and proportional solenoid. The position of the measurement orifice (3) is measured by the inductive position transducer.

Any deviation from the command value is compensated through feedback control. The pressure compensator (4) keeps the pressure drop at the measurement orifice (3) at a constant value at all times. Therefore, the flow is load compensated. The low temperature drift is achieved due to the design of the measurement orifice.

With a command value of 0%, the measurement orifice is closed. In the case of a power failure or a cable break at the inductive position transducer, the measurement orifice closes. When the command value is 0%, it is possible a start-up without overshoot. The opening and closing of the measurement orifice can delay via two ramps in the proportional amplifier. Via the check valve (5) a free flow from B to A is possible.

By installing a rectifier sandwich plate Z4S6... under the proportional flow control valve, the flow from the actuator can be controlled in both directions.

Model 2FRE6B-2XJ/

Proportional flow control valve model 2FRE6A-2XJ/ (with external closing, without check valve)

In principle, the function of this valve is similar with the valve 2FRE6B-2XJ/K4RV.

To suppress the start-up jump when the measurement orifice (3) (command value > 0%) is open, a closing of the pressure compensator (4) is provided via port P (6). The internal connection between port A and the pressure compensator (4) is blocked. Via the external port P (6), the pressure in port P of the directional valve (8) acts on the pressure compensator (4) and keeps it in its closed position against the spring force (7).

If the directional valve (8) is switched from P to B, the pressure compensator (4) moves from the closed position to the corresponding compensation position, thus start-up jump is avoided.

Component size	09

Features

- With pressure compensation for the pressure compensated control a flow
- Operation by proportional solenoid
- With electrical position feedback of control throttler
- The position transducer coil is axially adjusted to make the zero position adjustment of the throttle port easy (electrical, hydraulic) without the need to adjust the electronics
- Minimum sample variation of valve 2FRE and proportional amplifiers

Function description, sectional drawing

The 2FRE... proportional flow control valves have a 2-way function. They can control a corresponding flow with a large degree of compensation for pressure and temperature according to the provided electrical command value. The valve basically consists of valve body (1), proportional solenoid with inductive position transducer (2), measurement orifice (3), pressure compensator (4), stroke limiter (5) and optional check valve (6).

The setting of the flow rate (0 to 100%) is determined on the command value potentiometer. The setting of the flow (0 to 100%) is determined by the command value potentiometer. The applied command value adjusts the measurement orifice (3) via the amplifier and proportional solenoid. The position of the measurement orifice (3) is measured by the inductive position transducer. Any deviation from the command value is compensated through feedback control. The pressure compensator (4) keeps the pressure drop at the measurement orifice (3) at a constant value at all times. Therefore, the flow is load compensated. The low temperature drift is achieved due to the design of the measurement orifice.

With a command value of 0%, the measurement orifice is closed. In the case of a power failure or a cable break at the inductive position transducer, the measurement orifice closes. When the command value is 0%, it is possible a start-up without overshoot. The opening and closing of the measurement orifice can be delay via two ramps in the proportional amplifier. Via the check valve (6) a free flow from B to A is possible.

By installing a rectifier sandwich plate Z4S6... under the proportional flow control valve, the flow from the actuator can be controlled in both directions.

Function description, sectional drawing

The 4WRPEH valve is high-performance servo proportional valve with zero cover structure on the valve spool and valve sleeve, and LVDT position transducer, it can regulate the directional and flow steplessly according to the input electrical signals.

The valve mainly consists of valve body (1), valve spool (2), valve sleeve (3), control solenoid with position transducer (4), and optionally integrated amplifier (5).

The valve drives the movement of the spool on one side through the proportional solenoid. The specified command value is compared with the actual position value in the integrated electronics (OBE). In case of control deviation, the stroke solenoid is activated, which adjusts the control spool against the spring due to the changed solenoid force. The stroke/control spool cross-section is regulated proportionally to the command value. When the command value presetting of 0V, the electronics adjusts the control spool against the spring to the central position. In deactivated condition, the spring is untensioned to a maximum and the valve is in fail-safe position.

When the solenoid switched off, the valve is moved to fail-safe position. And after powered on, the valve spool is pushed from the rest position to the required position according to the size of the input electrical signal to achieve free flow of oil from P to A and B to T, or P to B and A to T.

The 7-pin connector (6) is used for connecting power, analog signal input, and detection signals.

Function description, sectional drawing

The 4WRPEH valve is high-performance servo proportional valve with zero cover structure on the valve spool and valve sleeve, and LVDT position transducer, it can regulate the directional and flow steplessly according to the input electrical signals.

The valve mainly consists of valve body (1), valve spool (2), valve sleeve (3), control solenoid with position transducer (4), and optionally integrated amplifier (5).

The valve drives the movement of the spool on one side through the proportional solenoid. The specified command value is compared with the actual position value in the integrated electronics (OBE). In case of control deviation, the stroke solenoid is activated, which adjusts the control spool against the spring due to the changed solenoid force. The stroke/control spool cross-section is regulated proportionally to the command value. When the command value presetting of 0V, the electronics adjusts the control spool against the spring to the central position. In deactivated condition, the spring is untensioned to a maximum and the valve is in fail-safe position.

When the solenoid switched off, the valve is moved to fail-safe position. And after powered on, the valve spool is pushed from the rest position to the required position according to the size of the input electrical signal to achieve free flow of oil from P to A and B to T, or P to B and A to T.

The 7-pin connector (6) is used for connecting power, analog signal input, and detection signals.

Technical parameters

Overview			
Structure	Direct operated spool valve with steel sleeve		
Actuation	Proportional solenoid valve with position controller, OBE		
Installation type	subplate mounting, porting pattern to ISO 4401 -03-02-05		
Installation position	Optional		
Environment temperature range	°C -20 ~ +50		
weight	kg	7.1	
Vibration resistance (testing conditions)	Maximum 25g, space vibrating test in all directions (24h)		
Hydraulic (Measured when using HLP46, $\vartheta_{oil}=40^{\circ}\text{C} \pm 5^{\circ}\text{C}$)			
Fluid	Oil according to DIN 51524. For other oils, please consult our company		
Viscosity range	Recommended value	mm ² /s	20...100
	Maximum allowable value	mm ² /s	10...800
Oil temperature range	°C -20 to +70		
The maximum allowable pollution level of oil to ISO 4406 (c)	Class 18/16/13 ¹⁾		
Nominal flow rate ($\Delta p=35$ bar/throttle edge)	L/min	50	100
Maximum working pressure	bar	Port A, B, P: 315	
		Port T: 250	
Leakage flow at 100 bar	Linear	cm ³ /min	<1200
	Nonlinear	cm ³ /min	<600
Static/dynamic			
Hysteresis	%	≤0.2	
Response time for signal changes 0-100%	ms	10	
Zero drift	At $\Delta T=40^{\circ}\text{C}$, zero drift <1%		
Zero position adjustment	Factory setting $\pm 1\%$		
Electrical, amplifier integrated in valve			
Power on rate	%	100ED	
Protection grade	IP65 (plug installed)		
Connection	Plug-in connector 6P+PE, DIN 43563		
Supply voltage	24V DC _{nom}		
Terminal A	Min. 21VDC/max. 40VDC		
Terminal B: 0V	0V (ripple max.2)		
External fuse	A _F	2.5	
Input, version "A1"	Analog differential signal input, Ri=100k Ω		
Terminal D(U _D)	0...±10V		
Terminal E	0V		
Input, version "F1"	Load, R _{sh} =200 Ω		
Terminal D(I _{D,E})	4...12...20mA		
Terminal E(I _{D,E})	Current loop I _{D,E} feedback		
Test signal, version "A1"	LVDT		
Terminal F(U _{I_{test}})	0...±10V		
Terminal C	Reference 0V		
Test signal, version "F1"	LVDT signal 4... (12).. 20 mA		
Terminal F(I _{F,E})	200...500Ω		
Terminal C(I _{F,C})	4... (12)... 20 mA (output current)		
	Current loop I _{F,C} feedback		
Adjustment	Calibrate at the factory and see the characteristic curve of the valve		

The oil must meet the cleanliness degree requested by the components in the hydraulic system. Effective oil filtration can prevent failure and increase the service life of the components.

Electrical connections

Technical data for the cable:

- Version: - Multi-core wire
- Litz wire structure, extra fine wire according to VDE 0295, class 6
- Protective earthing conductor, green-yellow
- Cu shielding braid
- Wire number: - determined by the valve model, plug model, and signal arrangement
- Line Ø: - 0.75 mm² to 20 m of length
- 1.0 mm² to 40 m of length
- OuterØ: - 9.4...11.8mm
- 12.7...13.5mm

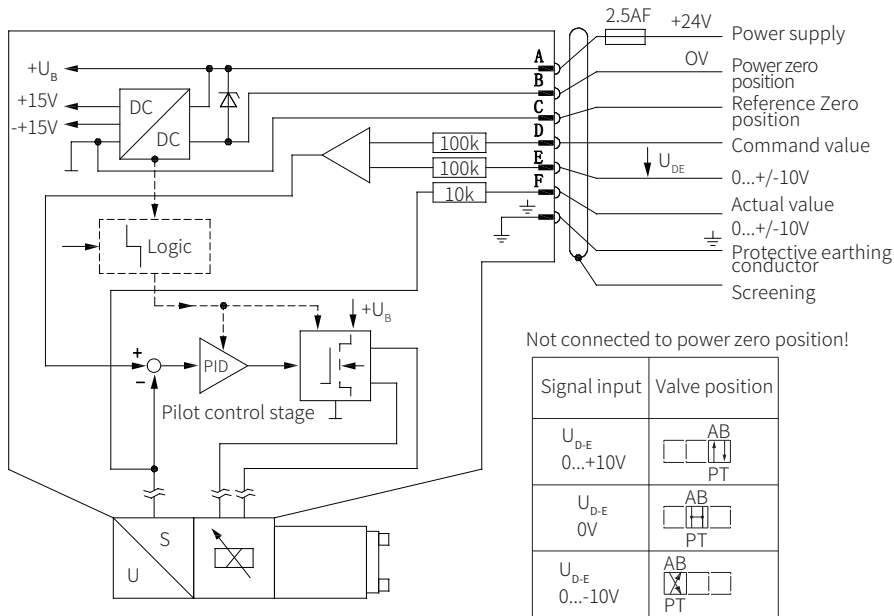

Note:

Supply voltage 24 V DC_{nom}
if the value falls below 18V, an internal fast switch-off is effected which can be compared with "Release OFF"
Additionally for version F1:
I_{D,E} ≥ 3mA - valve is active
I_{D,E} ≤ 2mA - valve is deactivated
Electric signals taken out via control electronics (e.g. actual value) may not be used for the switch-off of safety-relevant machine functions.
(See the European standard "Safety requirements for fluid power systems and their components - Hydraulics", EN 982.)

As the product is in constant development and innovation, the information in this brochure is not specific to the special conditions or applicability of a specific industry, thus Jiayite Hydraulics company is not responsible for any incomplete or inaccurate description generated.

Function description, sectional drawing

The 2-way logic cartridge valves are designed as components for integrated blocks. The main valve component with oil ports A and B is installed into the control block in a receiving hole standardized according to DIN ISO 7368 and closed with a cover. In most cases, the control cover is the connection between the control side of the main valve component and the pilot valve.

By control with respective pilot control valves, the main valve component can be applied for pressure, directional and throttle functions or a combination of these functions. The special economical structural designs can be achieved by matching the size of various flows of the valves and the actuators. If the main valve component can undertake more than one function, the special economical structure can be achieved.

Directional function

The 2-way logic cartridge valves generally consist of control cover (1) and cartridge element (2). The control cover contains control holes, optional stroke limitation according to function, hydraulic control directional seat valve or shuttle valve. In addition, the directional spool valve or directional seat valve can be installed onto the control cover. The cartridge element mainly includes valve sleeve (3), adjustment ring (4) (only applicable to size 32), seat valve (5), optional damping (7) and reset spring (8).

Function

The function of 2-way logic cartridge valves depends on the pressure. Therefore, there are three important pressure-bearing areas A1, A2, A3 for actuation of the valve. The area of the valve seat A1 is taken as 100%. Depending on the type, the annulus area A2 is 7% or 50% of the area A1. Therefore, the area ratio A1:A2 is either 14.3:1 or 2:1. The area A3 is equal to A1+A2. Due to the different area ratios A1:A2, the annulus area A2 is also different. The area A3 may be 107% or 150% when 100% area at seat A1.

Basic application

The areas A1 and A2 are operated in the opening direction. The area A3 and the spring are operated in the closing direction. The effective direction generated by the combination of the opening and closing directions determines the position of the spool of the 2-way logic cartridge valve.

The oil can flow from A to B or B to A through the 2-way logic cartridge valve. When the area A3 is compressed by the pilot oil of channel B or external pilot oil supply, the channel A is closed without leakage."

Size 16 to 32

Size 40 to 63

Component size

Size unit: mm

Control cover and installation hole according to ISO 7368

1 Depth of fit

2 Reference dimension

3 If the diameter of port B is not $\Phi D3$ or $(\Phi D3^*)$, then the distance from the cover support surface to the center of the hole must be calculated.

4 Port B can be installed around the central axis of port A, but it must be ensured that the installation hole and pilot hole are not damaged

5 Locating pin hole

6 The length L1 (x-y axis of the hole) of the control cover (with directional valve) is 80mm for size 16.

7 If $D \leq 45\text{mm}$, H8 is allowed to be installed.

Features

- Cartridge spool and various sleeves to meet relief and reducing function
- One sleeve with multi-spool in cartridge structure
- Area ratio 1:1 and 1.07:1
- Optional throttle
- Different cracking pressures

Function description, sectional drawing

General

The 2-way logic cartridge pressure valves are pilot operated poppet valves or spool valves. The main valve component is a logic cartridge valve (1) which is inserted into the standard hole according to DIN 7368 and sealed with control cover.

The pilot valve (4) is integrated into the control cover (2) or installed as mounting valve onto the control cover (2). Its mounting surface is in accordance with DIN24340(2). The different pressure functions can be realized by combining the logic cartridge valve and control cover.

Model LC..DB..D.. Model LC..DB..E..

Pressure relief function

Control cover LFA... DB...
Logic cartridge valve LC... DB...

The logic cartridge valve (1) (model LC... DB...) with pressure relief function is a seat valve with an area ratio 1:1 (no effective area at port B). The pressure acting at port A is fed to the spring cavity (6) of the main valve through the pilot oil supply orifice (5). When the pressure is lower than the setting pressure of the pilot valve (4), the hydraulic force on the main spool (3) is balanced and the spring force keeps the main valve closed. When the pressure reaches the set value, the main spool opens and limits the pressure at port A according to the pressure-flow characteristics.

Model LFA..DB..

Model LC..DB..

Function description, sectional drawing

Pressure reducing function

a) Normally open: Control cover LFA...DB...
Logic cartridge valve LC...DR...

The logic cartridge valve with pressure reducing function is seat valve with an area ratio of 1:1 (no effective area at port B). It adopts the control cover (model LFA...DB...) which has same function with the relief valve as pilot valve.

The pressure acting at port A is fed to the spring cavity of the main valve through the pilot oil supply orifice. When the pressure is lower than the setting pressure of the pilot valve, the hydraulic force on the main spool is balanced and the spring force keeps the main valve spool open. The fluid can flow freely from B to A. When the pressure reaches the set value, the main spool closes and reducing the pressure at port A according to the pressure-flow characteristics.

e.g. Model LFA..DB..
Model LC..DR..

b) Normally closed: Control cover LFA...DR...
Logic cartridge valve LC...DB..D...

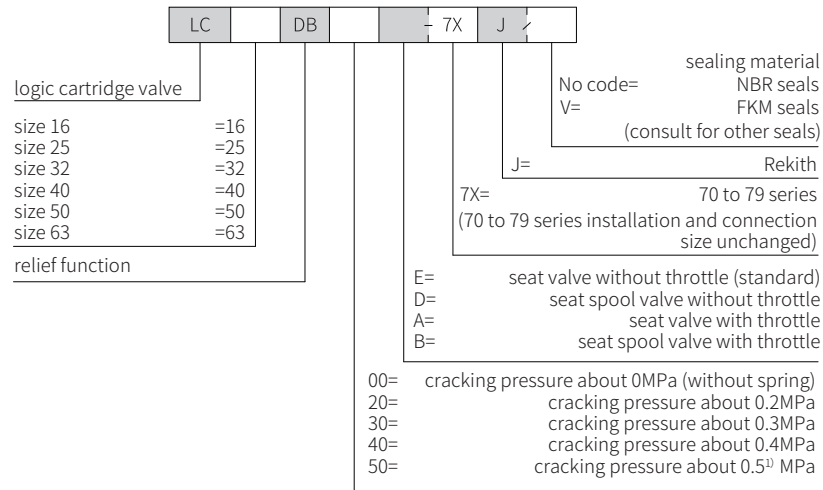

For the pressure reducing function with opening characteristics, a logic cartridge pressure relief valve (mode LC...DB..D...) and a control cover (model LFA...DR) with a pressure reducing valve as the pilot valve are used.

The pilot control oil supplied from port A flows into port B through the pilot oil supply orifice and the opened pilot reducing valve. The main spool is opened to allow freely flow from A to B. When the set pressure is reached, the main spool closes and reduces the pressure at port B according to the pressure-flow characteristics.

If the unexpected pressure increases on the pressure reducing side (port B), pressure relief via the third port of the pilot valve. By installing a directional valve, an additional isolating function can also be attained (model LFA...DRW...).

e.g. Model LFA..DR..
Model LC..DB40D..

Logic cartridge valves models and specifications

1) Only for size 16, 25, 32

Logic cartridge valves functional symbols

Technical parameters

Working medium	Mineral oil - for NBR seal or FKM seal Phosphate ester - for FKM seal						
Working medium temperature range °C	30 to +80 (NBR seal) 20 to +80 (FKM seal)						
Viscosity range mm ² /s	2.8 to 380						
Cleanliness of oil	The maximum allowable pollution level of oil is NAS1638 Class 9 and ISO4406 Class 20 / 18 / 15						
2-way logic cartridge valve							
Maximum working pressure-oil port A and B bar		420					
Maximum flow (Recommended)	Size	16	25	32	40	50	63
	Logic cartridge seat valves "E" and "A" L/min	300	450	600	1000	1600	2500
	Logic cartridge spool valves "D" and "B" L/min	175	300	450	700	1400	1750

1) The oil must meet the cleanliness degree requested by the components in the hydraulic system. Effective oil filtration can prevent failure and increase the service life of the components.

Characteristic curve

(Measured when using HLP46, $\vartheta_{oil}=40^{\circ}C \pm 5^{\circ}C$)
Size 16

The characteristic curve is measured when the external pilot oil drains at zero pressure. When the internal pilot oil drains, the inlet pressure increases along with the pressure at port B.

Characteristic curve

(Measured when using HLP46, $\vartheta_{oil} = 40^\circ\text{C} \pm 5^\circ\text{C}$)
Size 25

The characteristic curve is measured when the external pilot oil drains at zero pressure.

Technical parameters	03
Characteristic curve	03
Component size	04

Features

- Solenoid valve with various voltage, optional
- Used in the hydraulic system when the actuator elements need to be sequentially added on the basis of the original multi-way valve
- Adding more units to achieve the same multi-way valve and control two different actuator components in sequence
- 5 solenoid valves in series according to modular directional valve principle to control the sixth actuator component
- Port L must be always connected to the return oil tank

Function description, sectional drawing

The JYT-MH6WE6 two-position six-way directional valve is a multi-loop selector valve with a tubular connection.

It is mainly composed of valve body (1), valve spool (2), plug (3), pressure spring (4) and solenoid (5).
When the solenoid is energized, the valve spool is moved, the oil at port P1 flows out from port A and the oil at port P2 flows out from port B. When the solenoid is powered off, the oil at port P1 flows out from port C and the oil at port P2 flows out from port D.

Features

- Usable as stand-alone, or as multiple stackable units
- Control spool operated by solenoid with detachable coil fastened by a ring nut.
- Wet-pin tube for DC coil with push rod for mechanical override in case of voltage shortage
- Optional manual override (push-button)

Function description, sectional drawing

The JYT-MH8WE8 is a two-position six-way directional valve controlled by direct operated solenoid. The valve mainly consists of valve body (1), control spool (2), reset spring (3) and solenoid (5). This valve is used to connect two oil inlet ports P1 and P2, and transfer it to the outlet ports (C1-C4) with spool in position "0" when the solenoid is powered off, or to the outlet ports (C2-C3) with spool in position "1" when the solenoid is powered on. When the coil is powered off, the reset spring (3) pushes back the control spool (2) and keeps it in the position "0". The coil (4) is fixed to the magnetic tube by the ring nut (5). In the case of voltage shortage, the manual override (6) can also move the control spool (2) to connect to the external drain of the oil tank to ensure switching operations at higher working pressure.

Function description, sectional drawing

The HED4 type hydraulic-electric pressure switch is a piston pressure switch. It consists of the valve body (1), cartridge with piston (2), spring (3), adjusting element (4) and micro switch (5). The detected pressure acts on the piston (2), then the piston (2) is supported by the spring seat (6) and acts against the continuously adjustable force of the spring (3). The spring seat (6) transfers the movement of the piston (2) to the micro switch (5) to make the circuit switched on or off according to the design requirements.

- Pipe installation
- Vertical stacking systems
- Four pressure rating
- Plug with connection (lamp)

Function description, sectional drawing

The HED8 type hydraulic-electric pressure switch is a piston pressure switch. The pressure switch mainly includes the valve body (1), cartridge with spool (2), spring (3), adjusting element (4) and the micro switch (5).
If the monitored pressure is below the set value, the micro switch (5) will start working. The monitored hydraulic oil acts on the spool (2) through the damping hole (7). The spool (2) is supported by the spring seat (6) and acts against the continuously adjustable force of the spring (3). The spring seat (6) transfers the movement of the spool (2) to the micro switch (5) to release the micro switch (5) when the set pressure is reached. In this way, the circuit is switched on or off.
The mechanical structure of the spring seat (6) protects the micro switch (5) from damage when the pressure is reduced suddenly, and also prevents the spring (3) in case of overpressure.

Attention:
In order to extend the working life, the pressure switch should be mounted vibration-proof and protected from hydraulic pressure shocks.

Attached List

Installation height of directional valves and modular valves

(Size unit: mm)

Size 4

Valve	Directional valve	Z2S4 Hydraulic -operated check valve
Height	27	30

Note: According to the stack length, 4 pcs M5 GB/T 70.1 screws with suitable length or 4 pcs M5 studs with suitable length are used for size 4 valves.

Size 6

Valve	Directional valve	ZDR6 Pressure reducing valve	ZDB6 Pressure relief valve	Z2S6 Hydraulic -operated check valve	Z1S6 Check valve	Z2FS6...4X Modular restrictive valve	Sandwich plate of pressure switch
Height	42	40	40	40	40	40	40

Note: According to the stack length, 4 pcs M5 GB/T 70.1 screws with suitable length or 4 pcs M5 studs with suitable length added M5 nuts are used for size 6 valves.

Size 10

Valve	WE10 Solenoid operated directional valve	WEH10 Electro -hydraulic directional valve	ZDR10 Pressure reducing valve	ZDB10 Pressure relief valve	Z2S10 Hydraulic -operated check valve	Z1S10 Check valve	Z2FS10...4X Modular restrictive check valve	Sandwich plate of pressure switch
Height	30	35	50	50	50	50	50	50

Note: According to the stack length, 4 pcs M6 GB/T 70.1 screws with suitable length or 4 pcs M6 studs with suitable length added M6 nuts are used for size 10 valves.

Size 16

Valve	Directional valve	ZDB16 Pressure relief valve	Z2S16 Hydraulic -operated check valve	Z2FS16 Modular restrictive check valve
Height	43	80	80	51

Note: According to the stack length 4 pcs M10 GB/T 70.1 screws and 2 pcs M6 GB/T70.1 screws with suitable length, or 4 pcs M10 studs with suitable length added M10 nuts and 2 pcs M6 studs with suitable length added M6 nuts are used for size 16 valves

Size 22

Valve	Directional valve	ZDB22 Pressure relief valve	Z2S22 Hydraulic -operated check valve	Z2FS22 Modular restrictive check valve
Height	41	60	100	54

Note: According to the stack length, 6 pcs M12 GB/T 70.1 screws with suitable length or 6 pcs M12 studs with suitable length added M12 nuts are used for size 12 valves.

10 - Plugs for Valves and Sensors

Features

- Used as an accessory
- Plastic and metal varieties
- Various models and standards
- For solenoids, position sensors, and pressure sensors, valves with/without built-in amplifiers

Description

2P+PE 	Plug with lamp for solenoid of on/off valve DIN 43 650 ISO 4400	Features - Frosted transparent shell - DC/AC, optional - With or without cable, optional - Protection grade IP65
2P+PE 	Plug without lamp for solenoid of on/off valve DIN 43 650 ISO 4400	Features - Gray shell (A-end)/black shell (B-end) - DC/AC, optional - Without cable - Protection grade IP65
3P+PE 	Plug for pressure switch and sensor DIN 43 650 ISO 4400	Features - Black shell - With or without cable, optional - Protection grade IP65
2P+PE 	Plug with lamp for solenoid of on/off valve DIN 43 650 ISO 4400	Features - Transparent shell - With rectifier - Half wave rectification/full wave rectification, optional - Protection grade IP65
2P 	Deutsch water-proof plug (without lamp) for water-proof solenoid	Features - Deutsch horizontal insertion - DC - Customizable cable length - Protection grade IP67

Description

2P 	Deutsch water-proof plug (with lamp) for water-proof solenoid	Features - Deutsch horizontal insertion - DC - Customizable cable length - With LED indicate lamp - Protection grade IP67
2P+PE 	DIN plug connect to Deutsch water-proof plug DIN 43 650 ISO 4400	Features - Epoxy resin filling (shockproof, water-proof) - With LED indicate lamp - DC/AC, optional - Connect to Deutsch plug - Protection grade IP67
2P+PE 	DIN water-proof plug with cable DIN 43 650 ISO 4400	Features - Epoxy resin filling (shockproof, water-proof) - With LED indicate lamp - DC/AC, optional - Connect to Deutsch plug - Protection grade IP67
4P 	Plug with lamp and cable for valve with position monitoring sensor	Features - Frosted transparent shell - M12x1 threaded connection - Customizable cable length
2P+PE 	Plug for solenoid of proportional valve DINEN 175301-803 ISO 4400	Features - Gray shell (A-end)/black shell (B-end) - For proportional valve with external amplifier - Protection grade IP65
5P 	5-pin aviation plug for plug-in type proportional amplifier	Features - M12x1 threaded connection - Please refer to the connection in electrical connections of each proportional valve - Protection grade IP65
6P+PE 	7-pin aviation plug for valve with built-in amplifier DINEN 175201-804	Features - M22x1.5 threaded connection - Please refer to the connection in electrical connections of each proportional valve - Protection grade IP65
